Many Degrees of Policy Freedom

The Federal Government's Role in Care for Seniors

Harvey Lazar

Ottawa has at its disposal a full range of sound policy options that would help address the growing and underfunded care needs of seniors without undermining the leadership role of the provinces and territories in this area.

Ottawa dispose d'un éventail d'options en matière de politiques pour répondre aux besoins de soins grandissants des personnes âgées et au sous-financement dans ce domaine sans empiéter sur le leadership des provinces et territoires.

Summary

Although researchers have been warning of the aging of Canada's population for decades, governments do not yet have an overarching policy strategy to deal with the profound, long-term socio-economic implications of this demographic shift, let alone its more immediate impact on seniors' care. This study by Harvey Lazar is premised on the current imbalance between the demand for and supply of care for seniors, the expectation this imbalance will grow and the need to re-evaluate the federal government's policy role in this regard.

Formally, the constitutional responsibility for seniors' care rests with provincial/territorial governments. However, both they and the federal government play an important role. While the provinces/territories plan, manage, and oversee the delivery of health care and social services, federal pension and income support programs for seniors and transfer payments to the provinces for health and social services have a significant influence on the availability and accessibility of seniors' care. And in the context of an aging population, with the resulting labour shortages and mounting pressures on the health care system, Ottawa is likely to be called upon to do more.

Lazar examines the federal government's present role in care for seniors and its policy options for the future. He presents a full range of potential measures directed at both the demand and the supply sides of caregiving, and spanning the whole continuum of care from light to complex cases. He then assesses these options according to 1) whether they are compatible with the constitutional division of powers and functional intergovernmental relations, and 2) whether they constitute sound public policy based on 10 specific criteria and policy goals.

Lazar concludes that there are many degrees of policy freedom available to Ottawa to help address the growing and underfunded care needs of seniors, without undermining the leadership role of the provinces/territories in this area. While most of the measures he proposes are focused directly on seniors — to enhance their financial capacity to purchase the care services they need and provide insurance against catastrophic care costs — there are also some supply-side measures aimed at increasing caregiving capacity across the country.

Lazar points out that the next opportunity to make meaningful policy decisions on aging and care will be during the upcoming renegotiation of the health and social transfers due for renewal in 2014. In his view the onus is on the federal government to provide projections of seniors' care needs nationally and to articulate what future role it sees for itself, taking full account of how its interventions might influence the success of provincial care programs.

Résumé

Les tendances démographiques associées au vieillissement de la population sont connues depuis des décennies, pourtant, le Canada n'a toujours pas défini une stratégie globale pour faire face aux répercussions socioéconomiques à long terme de ce phénomène, et moins encore à ses conséquences immédiates pour ce qui est des soins aux personnes âgées. Cette étude de Harvey Lazar part du triple constat d'un déséquilibre entre la demande et la disponibilité des soins, d'une éventuelle aggravation de ce déséquilibre et d'une nécessaire réévaluation du rôle du gouvernement fédéral à cet égard.

En matière de soins, la responsabilité constitutionnelle appartient aux gouvernements provinciaux et territoriaux, mais le gouvernement fédéral lui aussi joue un rôle important. En effet, bien que les provinces planifient, gèrent et supervisent la prestation des soins de santé et des services sociaux, les programmes fédéraux de pension et de sécurité du revenu pour personnes âgées et les paiements de transfert aux provinces ont une grande influence sur la disponibilité des soins et leur accessibilité. À l'heure du vieillissement démographique, d'une pénurie appréhendée de main-d'œuvre et de l'accentuation des pressions sur le système de santé, Ottawa sera vraisemblablement appelé à faire davantage.

Harvey Lazar examine donc le rôle actuel et les possibilités d'action du gouvernement fédéral au chapitre des soins aux personnes âgées. Il propose un éventail de mesures qui permettraient d'intervenir à la fois du côté de la demande et de l'offre, et qui seraient adaptées aux particularités du continuum de soins. Il évalue ensuite ces options afin de déterminer si elles sont conformes : 1) au partage constitutionnel des pouvoirs législatifs et au bon fonctionnement de la fédération ; 2) à 10 critères et objectifs de « bonne » politique publique dans ce domaine.

L'auteur en conclut qu'Ottawa dispose d'une marge de manœuvre appréciable pour répondre aux besoins grandissants des personnes âgées et au sous-financement des soins sans empiéter sur le leadership des provinces et territoires. Bon nombre des mesures qu'il propose visent directement les aînés pour les protéger entre autres contre le coût prohibitif de certains soins et renforcer leur capacité financière afin qu'ils puissent se procurer les services dont ils ont besoin. Il met aussi de l'avant quelques mesures qui devraient accroître la capacité de prestation de soins partout au pays.

La prochaine occasion de prendre d'importantes décisions sur la question se présentera lors de la renégociation en 2014 des transferts fédéraux en matière de santé et de programmes sociaux. Or il revient à Ottawa d'établir un diagnostic clair sur les besoins futurs de soins aux personnes âgées à l'échelle du pays. Il lui faudra également mieux définir son propre rôle, tout en tenant compte de l'incidence de ses interventions sur l'efficacité des programmes de soins provinciaux.

Many Degrees of Policy Freedom: The Federal Government's Role in Care for Seniors

Harvey Lazar

Preparing for an aging society has long been recognized as an important multidimensional challenge for Canada. The prospect of this demographic transformation has prompted much research on the potential economic and social implications for individuals and society and has raised major public policy issues. In the 1970s and early 1980s, the main focus of research was on the retirement income system.¹ In the 1980s and 1990s, the effects of population aging on health care expenditures began to garner much attention. Both topics remain on the policy research agenda to this day, but a third theme has been added in recent years: the availability and cost of care for seniors.

Seniors' care is not an easy topic to research, partly because it involves informal interactions, financial and otherwise, within the family. Researchers have nonetheless made significant inroads in understanding the needs of care recipients and the sources of caregiving, which include the immediate and extended family, friends and neighbours, as well as community organizations, institutions (nursing homes, assisted living and complex care residences) and governments. There remain important research and knowledge gaps, however. For example, there is little information on the actual availability of informal caregivers for disabled individuals (e.g., the proximity of children or the health status of spouses), and there is still much to learn about the interaction between the formal and informal care networks and systems and how they might be affected by the ongoing demographic trends.

The issues related to the care system reach far beyond the front-line actors. All Canadians, regardless of age, are potential care recipients and caregivers. Once they reach their adult years they need to prepare for the contingency of receiving (as seniors or even younger) or providing (to a parent, spouse or friend) care. Like pension policy, care policy affects relations among generations, and what is considered to be fair among generations will differ depending on whether it is assessed within the confines of the family or at the level of society.

The object of this study is to spur a public debate about one aspect of care policy that has received little attention to date.² I am referring here to the way in which Canadian federalism affects the adequacy and availability of care for seniors. More particularly, I will look at the role the federal government has played in seniors' care to date and what its options could be, and should be, as the population aging process unfolds.

The division of powers in our constitution and the lessons from seven decades of practical experience provide a general guide to the respective roles of federal and provincial/territorial governments in regard to seniors. Looking at the issue through this wide-angle lens, we see that the federal government has the lead role in providing pensions and other forms of

income support, while the provinces plan, manage and oversee the delivery of health care and social services, including nonmedical care.

Since the current income support/service split between the two orders of government is relatively harmonious, it would be legitimate to ask whether it might not be best to leave well enough alone and not risk stirring up a hornet's nest. The fact is that this broad description of "who does what" is far from perfect. Examples that do not fit within this neat division of tasks include provincial/territorial responsibility for social assistance and the federal government's traditional role in the field of health care. It also brushes over the complex and inefficient overlap between the two orders of government in providing income support to people with disabilities.

This big picture also excludes the several ways in which the two jurisdictions inevitably intersect in carrying out their roles. At the constitutional level, provincial powers to make laws relating to old age and disability pensions trump federal authority. Accordingly, federal legislation in these areas requires the acquiescence, if not the enthusiastic support, of the provinces. At the operational level, Ottawa's decisions can influence provincial governments through either the level of income support that it provides to seniors or the magnitude of its cash transfers to the provinces and territories. Indeed, access to care for seniors is heavily affected by the decisions of both orders of government, as well as by the way in which governments interact.

Governments loom large in the lives of retired people. Over three-quarters of the aggregate income of those aged 65 and older comes from pensions — 42 percent from public pensions and 34 percent from private pensions. Lower-income Canadians are even more reliant on public plans, which account for as much as 80 to 100 percent of their income. The elderly also receive a larger proportion of the services they require through governments or government-subsidized activities than do people of working age.

The federal government delivers almost all public pensions (the main exception being the Quebec Pension Plan), and it also plays a large role in supporting private pension plans through income tax incentives. The federal government does not, of course, view its major retirement income programs (e.g., Old Age Security, Guaranteed Income Supplement, Canada Pension Plan, Registered Pension Plans and Registered Retirement Savings Plans) as part of the care system. But the impact of these policies on how care is organized is nonetheless profound. For example, the extent to which provincial/territorial governments need to plan for and subsidize care for an aging population is linked to the income levels of retired people. The more income they have, the more they are able to pay for services — including many kinds of care — on their own.

Another way that federal policies can influence provincial care decisions is through health and social transfers to the provinces. For instance, through the Canada Social Transfer (CST), Ottawa provides direct cash contributions to the provinces and territories, "notionally" (a term used by the federal Department of Finance) for social services, including care services. However, under current fiscal arrangements, the CST and other large federal transfers will

expire on March 31, 2014. During the 2011 federal election campaign, the Conservative platform stated that the government “would work collaboratively with the provinces and territories to renew the Health Accord” (Conservative Party 2011, 30), but it failed to mention the CST. Nor was the CST mentioned in the subsequent federal budget, presented on June 6, 2011.³ The reality is that the nonhealth costs of aging involve large sums and they interact significantly with the health costs.

Overall, the current relationship between the two orders of government in respect of pension policy and care challenges is low key, notwithstanding concerns about distressing system failures in the recent past (such as the insolvency of some big private pension plans). For the most part, intergovernmental differences are managed without serious tensions. Indeed, there are ongoing discussions among federal, provincial and territorial governments on adding a further tranche to the retirement income system.⁴

This study is thus not motivated by a sense of crisis in intergovernmental relations. Rather, the main concern is that Canadians and their governments have not been preparing sufficiently for the kind of older society that they will constitute less than two decades from now. The aging of the population guarantees that the Canada of tomorrow will be quite different than the Canada of today. Since desirable policy outcomes on this front will likely require long lead times, postponing decisions about how to best prepare until some murky date in the future would in itself be a decision about the nature of that future.

Both orders of government now play a direct and/or indirect role in meeting care needs. The fact that their decision-making processes function largely independently of one another is far from a bad thing, since federal-provincial processes are not known for their speed or efficiency. Given their interaction on care issues, however, it is essential that each order of government understand not only the direct effects of its decisions on citizens, but also the consequences of these decisions for the programs of the other order of government in relation to these same citizens. The social issues are too important and the amounts of money too large for governments to ignore these ripple effects. These effects are not symmetrical. Provincial/territorial decisions only occasionally affect federal policies related to seniors' well-being, whereas federal decisions have large, ongoing, direct and indirect impacts on provincial care programs. It is essential, therefore, that the federal government take into account how its interventions might influence the success of provincial care programs and ultimately the well-being of those who require care.

This study has two purposes. Assuming that Ottawa continues to respect the constitutional and policy pre-eminence of the provinces in care policy, the first is to determine whether and in what ways Canada's federal structure influences the strategic choices available to the federal government in responding to the growing care needs of seniors. The second is to examine what Ottawa's role could be in the future, and assess it in relation to two sets of standards: those that pertain to federalism principles and functional intergovernmental relations, and those that take account of other public policy criteria such as efficiency, equity and accountability.

To foreshadow my conclusions: Notwithstanding constitutional limits on what the federal government can do directly in the sphere of caregiving, and taking full account of the leadership role of the provinces, there are many degrees of policy freedom available to Ottawa in addressing the growing and severely underfunded care needs of seniors.⁵ Viable options include measures aimed at seniors with light or intermediate care needs, as well as measures designed to enhance access to and provision of prolonged, complex care, and they relate to both the demand and the supply sides of caregiving.

Demand refers to the volume and the complexity of the care services required by seniors to ensure their well-being.⁶ Demand for care is determined by individuals' health and personal circumstances. Supply refers to all caregivers who are willing and able to perform the tasks for which there is a demand. These caregivers include family, friends, neighbours and volunteers who traditionally have not been paid for the assistance they provide (although this has begun to change); professional caregivers who work for provincial/territorial governments or nonprofit organizations; and businesses and individuals who provide care services at a price.

Demand is linked to the idea of personal autonomy. Ideally, personal autonomy means there are minimal limitations on a person's activity and minimal restrictions on her participation in society.⁷ In the context of this study, it also entails having choices and the ability to make one's own decisions in terms of caregivers and living conditions. In practice, however, care recipients' personal autonomy will be determined by their health status and the formal and informal support systems and services that are available to them. Some of the measures required to maintain or increase care recipients' personal autonomy may be costly, some may actually save money. In any event, personal autonomy is an issue that must be considered in any debate about care policy, and it is increasingly reflected in health officials' efforts to enable people who require care to receive it at home for as long as possible.

Another important theme in this study is intergenerational equity. This refers to fairness in financial and other relationships between different generations. In one idealized version of this concept, each generation would pay for its own benefits, requiring no transfers from other generations. However, achieving a modicum of fairness between generations is very difficult in practice. This becomes apparent as soon as one begins to consider the details of a new seniors' care benefit: Should it be phased in over several decades, or should it be implemented immediately? If the phase-in period is long — say, 30 or 40 years — there will be little or no reduction in current unmet care needs. If the benefit is implemented fully without any phase-in, it may well be unfair to current taxpayers and, most acutely, to the younger cohorts. They may end up “paying twice,” contributing through higher taxes or other levies to cover the costs of the incremental care services made available to current seniors, and also paying for their own future benefits (by either participating in a public contributory plan or saving on their own). These younger taxpayers cannot rely on the future workforce to subsidize them when they become seniors, because with population aging, the future workforce may be too small and the future elderly too numerous to sustain the intergenerational subsidy. Balancing these intergenerational transfers in an aging society is a crucial issue in decision-making and a fundamental consideration in my analysis.⁸

These two themes can be linked. To the extent that maintaining seniors' autonomy reduces public costs, it also reduces the size of any intergenerational transfers. When these considerations are aligned, policy is likely to be on a positive course. When they are in tension, policy choices are more difficult.

The study is organized as follows. In the first section, I set out six research premises regarding the care needs of seniors, the capacity of individuals to plan for themselves and Ottawa's potential role in this policy area that frame the subsequent analysis. I also present the federalism/intergovernmental relations criteria and 10 other policy criteria that will be used to assess each option.

To provide a context for the discussion of care policy options that follows, I then review what Ottawa is currently doing, directly or indirectly, in relation to caregiving in four areas: income security for retirees, financing of social programs through the spending power, support for informal caregivers, and knowledge and information dissemination, and I examine how these various initiatives affect federal-provincial relations.

In the next two sections, I present a wide range of policy options available to the federal government. The list of 19 options is not exhaustive, but it serves to illustrate the types of choices that could be considered. While some of the options are new, there is a precedent for most of them in current arrangements or post-Second World War history. A clear distinction is made in the analysis between the instruments that are suitable to address lighter and intermediate care needs and those that are more appropriate in the context of prolonged, complex care. Some options support the demand side of care, while others are meant to further develop the supply side. I then assess all of the options in terms of their probable effects on intergovernmental relations and against the policy criteria referred to above.

It should be noted that the options are presented at a high level of generality, with little elaboration of design/costs and little reference to the current economic or fiscal environment. The reasons for this are twofold. First, the purpose of this study is to explore the broad implications and trade-offs associated with different strategic directions, and more precisely to determine whether federalism will be a significant constraint on Ottawa's strategic role going forward. Second, the time horizon for the issues examined in this study is years and even decades, not months. I conclude briefly in the final section.

Research Premises

The following premises frame the choice and assessment of possible options available to the federal government to support the provision of care for seniors.

First, the aging of the population will increase the need for care and the costs of care borne by governments. Like those of other industrialized countries, Canada's population is aging, due to a persistently low birth rate and increasing life expectancy. The aging of the baby boom generation (those born between 1946 and 1965) adds a cohort-specific dimension to this situation (Schellenberg and Ostrovsky 2008). The first boomers turn 65 in 2011 and will reach 85 in 2031. At the same time, the working-age population is

shrinking, and will continue to do so. Thus, beyond the increased demand for seniors' care, the growth in the number of seniors relative to those of working age will lead to added pressure on provincial/territorial budgets.

But it is not just the growth in the number of elderly that will increase costs. There is also the fact that the demand for care is age related. A Statistics Canada study based on surveys conducted in 1994-95 and 2003 found that about 2.5 percent of those aged 18 and over received subsidized care, whereas the figure was around 20 percent for those aged 80 and over (Wilkins 2006, 39-42). With the aging of the population, current projections suggest that the number of elderly Canadians needing assistance will double in the next 30 years (Carrière et al. 2007, figure 6; Alzheimer Society 2010).

The unit costs of care services are also likely to increase, as the relative scarcity of caregivers will strengthen their bargaining position on wages and benefits. I use the word "likely," because it is uncertain whether the labour market for caregivers behaves like a conventional service-industry market. If it does, wages will increase, and as compensation rises, the supply of caregivers will grow. If it does not, governments will need to consider supplementing caregivers' compensation to increase their supply.

There are similar demographic concerns with informal care. Statistics Canada observes that "63 per cent of adults with disabilities who received help obtained it from members of their family living with them, 42 per cent received it from family members not living with them, 24 percent from friends and neighbours" (2003, 7). In 2007, 4.1 million Canadians aged 45 and over were providing some form of care to someone with a long-term health condition or physical limitation (Statistics Canada 2008a). However, socio-demographic trends suggest that the network of available informal caregivers will be smaller in the future. And this, combined with greater demand for care, could lead to large and increasing shortfalls in informal caregivers going forward (Keefe, forthcoming). The magnitude of such shortfalls is difficult to project, but it is likely to be significant. The 2001 Participation and Activity Limitation Survey reported that roughly one-third of people with disabilities reported unmet care needs (Statistics Canada 2003, 7). Another survey found that while more people received subsidized home care in 2003 than in 1994-95, the proportion of people needing but not receiving help was also significantly larger (Wilkins 2006).

To sum up, growing shortfalls in the supply of formal and informal caregiving services in the future will put pressure on the provinces and territories to increase the amount of government-subsidized care they provide.

Second, there is great diversity in the care needs of seniors, and the range of services they require can be thought of as a continuum. At one end are people with mild disabilities and relatively easy-to-manage symptoms. At the other end are people with the most severe problems and disabilities (MacKenzie, Hurst and Crompton 2009, 57). Accordingly, it is appropriate for governments to have different policies at different points in the care continuum.

People with lighter care needs will usually live in their own home or with family. Some may have a chronic condition that limits their mobility, in which case they may require homemaking and home

support on a regular but infrequent basis. Others may be at home after spending time in a rehabilitation facility. They may need a range of homemaking and personal care services and perhaps further physiotherapy until their recovery is complete. Their need for care is thus likely temporary.

Those with intermediate care needs often have chronic conditions that have deteriorated to the point where their mobility is significantly limited. Others may be experiencing the first symptoms of cognitive impairment. (A study commissioned by the Alzheimer Society states that 55 percent of Canadians aged 65 and over with dementia live at home, and that the percentage is expected to increase [2010, 7].) Individuals who are receiving post-acute care at home rather than in hospital may also be receiving intermediate care temporarily. Intermediate care services will, on average, be more numerous, more frequent and more specialized than those required at the light end of the continuum. More often than not, people requiring this level of care are still living at home, although there are other options such as supportive housing and assisted housing. In either case, some of the assistance they receive may come from a provincial home care program, on either a subsidized or a nonsubsidized basis, depending on their income or that of a partner with whom they may be living.

The heavy end of the care continuum also encompasses a wide range of situations. The term “heavy” is used in this context to refer to the range and level of services required by individuals whose condition is both complex and of long duration, and thus very costly. This includes individuals who lack the physical or mental capacity to perform many of the activities of daily living without assistance; those whose cognitive impairment is severe enough to make communication difficult; those with severe behavioural difficulties; and those in end-of-life situations. Such individuals may reside in a tightly supervised group setting, a palliative care clinic, a long-term care facility or at home but with assistance readily available at all times. The term most often used by governments to describe the services required by people at this end of the continuum is “complex care” (see, for example, British Columbia 2010) or “complex continuing care” (see Ontario 2011). In a free-market setting, for people who require complex care for extended periods (years rather than weeks), the costs can be catastrophic, consuming all of their income and ultimately necessitating the sale of all their assets.

This diversity of needs is of course reflected in the types of care services required and the related costs. For some services the provider must have considerable education and training. But many types of assistance require little specialized training and, as mentioned, tend to be provided by spouses, children, other relatives, friends, neighbours and volunteers on an unpaid basis. Some care recipients try to spare relatives and friends the time and effort of caregiving by purchasing services privately or obtaining them through public programs. Indeed, this may increasingly be the case as societal values and expectations begin to change (see Keefe, forthcoming).

Ultimately, there is a world of difference between the 65-year-old retiree with some modest limitations on her mobility married to a healthy man who takes on some of the physical chores that she previously performed, and the 90-year-old widow who has had advanced

dementia for several years and is living in secure assisted housing with 24-hour surveillance. This suggests that government strategies should be flexible enough to respond according to the various needs at different points on the care continuum.

Third, individuals should plan their retirement with the expectation that they may need to pay for some care services, but planning for and financing catastrophic care costs is best done by pooling the risk at the societal level. Most people will require some form of care at some point in their later years, and in general there is no reason why they should not have planned their financial affairs during their working years such that they can pay for a moderate level of services in retirement. (This may not apply to the long-term unemployed or those with long-term dependence on social assistance or disability income supports.)

But that being said, it is impossible for most working-age individuals to know how much and what kinds of care they might need in their retirement years. This “unknowability” in terms of future care requirements raises important issues. It is unreasonable to expect individuals to save enough during their working years to cover the relatively low probability but high costs of requiring prolonged, complex care.⁹ Yet we know that some individuals will face catastrophic care costs. The usual way for individuals to protect themselves against such a contingency is by pooling the risk through insurance. An important consideration is whether such insurance should be provided through the private market or social insurance.¹⁰

The Canadian Life and Health Insurance Association has estimated that 400,000 Canadians have long-term care coverage (CLHIA 2011). Given that there are about 18 million Canadians in the labour force and about 20 million between the ages of 20 and 64, it is clear that to date long-term care has been a relatively small market for insurers. Based on US studies, those who are most likely to need care in their postretirement years — those who develop chronic progressive illnesses or have permanent disabilities — are also least likely to be able to purchase insurance. High-income earners are also much more likely than low-income earners to purchase insurance for caregiving services.¹¹

These and other particularities of long-term care and the market for private insurance suggest that social insurance is the best strategy (see Grignon, forthcoming). What is unknown in terms of risk and probability at the level of the individual can be estimated with much more certainty for the population as a whole. Available data make it feasible to estimate the longevity and morbidity of different cohorts. As new data become available, estimates can be revised and any resulting costs spread broadly rather than being absorbed by individuals. This social insurance role for public policy will be discussed more fully later in the study.

Fourth, notwithstanding provincial/territorial leadership in care policy, the federal government plays a useful, albeit almost exclusively indirect, role in this sphere. Various subsections of section 92 of the *Constitution Act, 1867*¹² make it clear that each province is responsible for deciding what kind of care system it will develop, regulating that system, certifying the credentials of caregivers, fostering or developing the supply side (caregivers,

institutions, etc.) and helping to ensure that it is funded. But the federal government is far from irrelevant. Federal powers related to taxation and old age pensions have considerable influence on the demand side of the care system. The federal spending power may also have affected the supply side through transfers to provincial governments, although the magnitude of any such effect is unknown. In short, on both the demand and the supply sides, the federal government has for the most part been an indirect player in the care system. Yet the anticipated shortages of formal and informal caregivers will generate pressure on Ottawa to contribute financially to a solution.

Fifth, in deciding on whether and how it responds to these calls for financial support, the federal government will have to take into account the economic status of seniors as well as the costs of care. But in fact, Ottawa lacks much of the information and analysis needed to make an informed and considered decision on the extent of its financial commitment.

Two kinds of information are required as a starting point. The first relates to the income and wealth of seniors in comparison with those of the working-age population. The government should not only have such information on a current basis, it should also have projections for the next two to three decades. The second concerns the costs of various care services, again looking ahead two to three decades.

The argument about the relevance of income and wealth is straightforward. Hypothetically, if the income of today's seniors were double what it actually is, the vast majority of seniors would probably have the purchasing power to pay for much, if not all, of the care services they need.¹³ This stronger demand for paid care services would create incentives for both the voluntary and the business sectors to expand supply. In this scenario, the funding role of governments in care provision would assuredly be much smaller than is the case today.¹⁴ The opposite would apply if the current income of the elderly were half what it is.

In fact, Canadian seniors are now better off economically than they have ever been relative to the working-age population. The proportion of seniors with incomes below Statistics Canada's low income cut-offs (LICOs) is less than half that of the population at large (Statistics Canada 2006a, charts 11-13). The proportion of seniors with low incomes after taxes fell from 10 percent in 1996 to 5 percent in 2006 (Statistics Canada 2008b). The main reason why so few seniors have low incomes is that the federal government's Guaranteed Income Supplement provides benefits for couples aged 65 and older that are above the LICOs, although in some cases just barely above, depending on where the couple is living.

LaRochelle-Côté, Myles and Picot (2008) found that the median income replacement rate for all seniors in a cohort that they studied was equal to 80 percent of preretirement income. This exceeds the 65 to 75 percent replacement rate usually cited as the rate needed to maintain a standard of living in retirement equal to that experienced during one's working years. They found considerable variation around the median, however, with over 20 percent of 75-year-olds having replacement rates below 60 percent, while 23 percent of those aged 69 to 71 had replacement rates over 100 percent. They also expressed concerns about whether current outcomes will

be sustained in the coming decades — concerns that Wolfson (2011) has strongly reinforced. With respect to wealth, Statistics Canada reports that in 2005 the median net worth of families aged 35 to 44, 45 to 54 and 55 to 64 was \$135,000, \$231,000 and \$407,000, respectively (Statistics Canada 2006b). The median net worth of those aged 65 and over was \$303,000 and had improved relative to those of the other age cohorts since 1999.

This suggests that current seniors are faring reasonably well compared with the working-age population, although how adequate their retirement incomes will be when care expenses start to accumulate is another matter. Given the large proportion of elderly Canadians with disabilities reporting unmet care needs, it is probable that virtually all seniors with incomes below the LICOs, and many of those with incomes at or just above them, are unable to pay for private care services after retirement, even if they need only modest assistance. What is not known is how much of the reported care deficiency overall is due to shortages of caregivers, to seniors' inability to pay for or access care services, or to other factors. To my knowledge, there has been no systematic assessment of the adequacy of the retirement income system in relation to the costs associated with different levels and durations of care.¹⁵ Future cohorts of seniors may fare reasonably well economically relative to the working-age population and yet have difficulty funding their care costs, given the policy status quo and the likely increases in the costs of care due to population aging.

The key point here is that the traditional analysis of the retirement income system has focused on two issues: its ability to prevent poverty and its effectiveness in enabling middle-income earners to maintain their living standards once they retire. A third question needs to be examined given ongoing demographic trends: the anticipated effectiveness of the retirement income system for future cohorts of retirees in relation to the anticipated care needs. Without such analysis there is little basis for Ottawa to decide what the extent of its contribution should be, if any, remembering that there are many calls on the public purse.

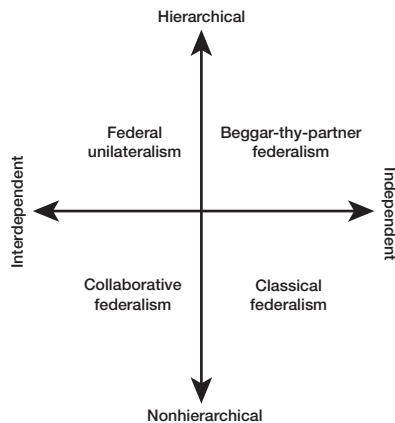

Sixth and finally, as part of its strategy, Ottawa should concentrate on ensuring a better balance between the demand and the supply sides of the care market. Demand-side measures are those that increase the purchasing power of the elderly and therefore their ability to buy the services they need in the marketplace. These include cash transfers and income tax provisions targeting seniors.¹⁶ Supply-side measures are government initiatives designed to add to the pool of care services, including formal and informal caregivers and various types of seniors' accommodation. An example would be capital grants to increase formal caregiver training or the stock of appropriate housing. Indirect measures might include grants or subsidized loans, typically for the same purposes, but channelled through provincial/territorial governments.¹⁷

As will be seen below, the federal government concentrates almost all of its activities on the demand side. It may wish to continue doing so, premised on the view that a demand-side focus is the most appropriate way of respecting the constitutional division of powers. Whether it pursues or modifies its demand-side role, however, Ottawa should at least consider whether it has the means to leverage improvements on the supply side, in consultation with the provinces/territories, in anticipation of the caregiver shortages described above.

Framework for Assessing Federal Initiatives Related to Seniors' Care

The classification of intergovernmental regimes is based on two sets of variables: the extent to which the federal-provincial relationship entails either independence or interdependence, and the extent to which it is hierarchical (coercive) or nonhierarchical (Lazar 2006). Figure 1 illustrates the classification system; each quadrant represents a distinctive form of federalism.

Figure 1: Forms of federalism

From the broad perspective of Canadian federalism politics, federal program initiatives that fit within the two regime types below the horizontal axis tend to be relatively benign. Classical federalism occurs when one or even both orders of government are acting within their constitutional sphere, and the actions of one require little or no response from the other — this is sometimes called “disentangled” federalism. The federal role in defence and the provincial/territorial role in primary education are examples of governments acting within

their areas of constitutional competence and requiring no response from the other order of government. (This does not mean that these competencies are hermetically sealed from each other, as becomes clear when Ottawa closes a defence base or makes a major military purchase.) The advantages of this form of federalism are that it is consistent with the constitutional division of legislative powers, it makes accountability clear, and it avoids the heavy intergovernmental transaction costs that occur when there is extensive interaction between orders of government.

Despite these advantages, it should come as no surprise that in a world of growing functional interdependence, a lot of domestic program activity involves both orders of government. Collaborative federalism — when noncoercive federal-provincial/territorial relations are involved — can be very demanding. Examples over the last couple of decades include the Infrastructure Stimulus Fund, the National Child Benefit, and Canada Student Loans and Grants. Transaction costs are incurred in the form of heavy demands on the time of public servants at both government levels and budgetary outlays for travel and communications. Collaborative federalism may entail negotiations that are never-ending, albeit with peaks and valleys, in much the way that the end of one round of collective bargaining in industrial relations can lead almost immediately to the staking out of positions for the next round. Since collaborative federalism presumes no coercion, it is also analogous to efforts to manage international relations without a hegemonic power.

While the effects of collaborative federalism on intergovernmental political relations are normally positive, and public opinion data frequently indicate that Canadians want their governments to cooperate, it is not uncommon to hear senior civil servants at both levels

muttering privately that they would prefer the disentangled relationships that are more typical of classical federalism.

Regimes above the horizontal axis are another story. They can create a lot of tension in the federation. Federal unilateralism arises when Ottawa exercises its spending power in an area of provincial/territorial constitutional competency without the uncoerced agreement of the provinces/territories. If Ottawa effectively coerces a province/territory to adopt a program that it otherwise would not have implemented through the incentives associated with matching grants, it is displaying federal unilateralism. The province/territory cannot afford to ignore the incentive, because if it does, its residents are effectively subsidizing Canadians in the rest of the country. Several provinces judged that Ottawa's 2000 Affordable Housing Program, which was a matching grant program, entailed this kind of coercion. Of course, what some provinces/territories view as desirable federal uses of the spending power, others view as undesirable. The Quebec government has consistently rejected the idea that such a federal constitutional power exists (Quebec 1998), while the Alberta government has almost as consistently rejected its political legitimacy.

"Beggar-thy-partner federalism" is rare but not entirely absent from domestic intergovernmental relations. It differs from federal unilateralism in that the initiative taken by Ottawa is within its constitutional competency. The coercion arises from the fact that the federal government's action or inaction imposes costs on the provinces/territories with minimal discussion or consultation. For example, to the extent that the federal government does not provide or arrange for the provision of adequate services for "Indians, and lands reserved for the Indians," for which it is constitutionally responsible (section 91 [24]), First Nations people who might have preferred to remain on reserve feel compelled to move off reserve to cities, leading to additional cost pressures on the provinces/territories for education, health and social services. It can also arise when Ottawa takes decisions to do more of something within its competency that effectively forces costs onto the provinces/territories. An example would be an amendment to the Criminal Code creating new offences, which adds administrative costs to provincial/territorial judicial systems without Ottawa negotiating to assume some share of those incremental costs.

Other criteria for policy assessment

The key objective of this study is to assess seniors' care policy options for the federal government and their effects on Canadian federalism. But in the real world of government decision-making, many other assessment values or criteria are considered before a new social policy initiative is launched. Accordingly, potential policy options are examined from a broader public policy perspective, taking into account the following 10 criteria:

- 1) Target efficiency: the efficiency with which the program target is met, whether the target is the client or the provider
- 2) Economic efficiency: the effects of a program on resource allocation
- 3) Horizontal equity: the extent to which a program treats persons in similar economic situations similarly regardless of their province/territory of residence

- 4) Redistributive equity: the extent to which a program redistributes income from higher- to lower-income persons
- 5) Intergenerational equity: the impact of a program on the legacy of assets and liabilities that current cohorts bequeath to future cohorts
- 6) Personal autonomy: the freedom of the individual who requires care to decide who will provide the care and where it will be provided
- 7) Mobility/portability: the lack of restrictions on seniors' mobility and/or portability of benefits from one jurisdiction to another
- 8) Accountability: the ease with which Parliament, legislatures and the citizenry can evaluate the effects of the incremental spending
- 9) Political credit: the ability of the government that raises the revenues to enjoy whatever credit accrues to the incremental spending
- 10) Administrative efficiency: the ease with which a measure/program can be implemented/delivered.

The Federal Government's Role in Seniors' Care

Notwithstanding the dominant role of the provinces/territories in legislating and regulating care, Ottawa has had some influence on the way that caregiving arrangements have evolved in Canada since the Second World War. Although the federal role is significant, as noted above and as will be seen further below, it is almost entirely indirect. As the effects of population aging start to be felt in all regions of the country, the electorate will more than likely demand that the federal government do a lot more to manage the adjustments required. What in fact has Ottawa done historically, and what is it doing now?

Although there are particular groups for which the federal government has special responsibilities, including the growing number of war veterans and First Nations people on reserves, this section focuses on the broader issue of what the federal government's role in caregiving has been for elderly Canadians, writ large, and how much additional policy freedom it has within the federal system. Table 1 lists the main policy instruments that Ottawa has used for purposes related to care or that have impacted on care, even if they were not intended specifically for that purpose.

Current retirees: The impact of the retirement income system

Ottawa influences the caregiving system chiefly by shaping the country's retirement income system and administering most of its largest programs. Even though provincial laws in respect of old age pensions constitutionally trump federal laws (see section 94A), Ottawa has historically been the lead political actor in creating the retirement income system. A principal source of income for current retirees is the public pension system. This includes Old Age Security (OAS), which dates from the early 1950s; the Canada Pension Plan (CPP) and the Guaranteed Income Supplement (GIS), both of which were enacted in the 1960s; as well as spousal and survivor allowances, which were developed mainly in the 1960s and 1970s. These are Canada's largest statutory expenses and, including the Quebec Pension Plan (QPP), in 2008, they were paying out in the order of \$60 billion annually

Table 1: Federal policy instruments that affect the demand for and/or the supply of care	
Instrument	Description
Demand side	
OAS/GIS, CPP and related allowances	Public pensions
RPPs, RRSPs and other registered instruments	Tax assistance for private retirement savings
Age amount, pension income credit, pension income splitting	Generic tax expenditures aimed at increasing seniors' disposable income
Tax credit for medical expenses and private insurance premiums, disability amount	Generic tax expenditures available for all taxpayers but that disproportionately benefit seniors
Supply side	
Eligible dependant credit, caregiver amount	Targeted tax expenditures aimed at supporting caregiving
Compassionate leave through the <i>Employment Insurance Act</i>	Direct financial support for caregivers on compassionate grounds
Combined demand and supply side	
CAP (1966-96)	Federal matching grants to provinces/territories to be used for social assistance and services to people in need
Extended Health Care Services (1977-96)	Federal per capita transfers to provinces/territories to be used for care services not covered by medicare
CHST (1996-2004), CST (2004-11)	Federal per capita transfers to provinces/territories to be used for social programs

(Finance Canada 2009, tables 10 and 39, adjusted to include CPP/QPP retirement pensions only). With regard to the CPP/QPP, it should be noted that these plans pay not only retirement pensions but also, and more significantly in terms of caregiving, disability pensions.

The federal government has also played a decisive role in encouraging private retirement savings and pensions for current retirees, through income tax incentives for Registered Pension Plans (RPPs), Registered Retirement Savings Plans (RRSPs) and a number of related instruments. In the mid-2000s, these registered private plans provided over \$40 billion annually in income to Canadian retirees and were growing more rapidly than the public plans. Gross federal revenue forgone in 2009 for these two programs was close to \$30 billion (Finance Canada 2009). The stock market sell-off in 2009 adversely affected this important source of retirement income, and the long-term effects of that event for future seniors remain uncertain.

Taken together, the public and tax-assisted private pension systems account for an estimated 60 percent of the income of people in their late 60s. This share rises to 70 percent for older seniors as the number of those still working dwindles.¹⁸ Compared with the situation in other OECD countries Canada's public pension system has strong antipoverty characteristics, but it provides relatively weak earnings replacement for middle- and high-income individuals. While pension policy reforms are unlikely to focus on the highest earners, the middle-income groups are a potential target for improvements to the retirement income system.

Several provisions of the federal *Income Tax Act* also influence the income situation of seniors. The "age amount" can be viewed as a way of helping seniors fund their own care by recognizing that they must bear the added health-related costs of growing older, although, as with the OAS, the age amount targets low-income and low-middle-income taxpayers. The age amount was projected

to reduce federal revenues by over \$2.2 billion in 2009. The pension income credit (worth \$945 million in 2009) and the relatively new pension income-splitting provisions (\$730 million in 2009) have similar impacts in that they reduce the tax burden of retirees, leaving them better able to finance their needs (Finance Canada 2009).

There are other tax expenditures that are relevant to this discussion. For example, under the *Income Tax Act*, out-of-pocket medical expenses above a specified threshold for taxpayers or their spouses are eligible for nonrefundable tax credits. So too are the costs of private health insurance. Also, a “disability amount” can be claimed as a nonrefundable credit by persons certified as having a physical or mental disability that is severe and prolonged and requires care. The projected federal revenues forgone for medical expense tax credits and disability credits in 2009 were \$945 million and \$415 million, respectively (Finance Canada 2009). Obviously these two credits are not restricted to seniors, but they are more closely related to the demand for care services than, say, the age amount or the pension income credit.

Two small provisions have a clear supply-side focus. An “eligible dependant credit” is available to a taxpayer who supports and lives alone with a dependant in a home that the taxpayer maintains. Revenue forgone for that program in 2009 was projected at \$765 million. There is also a targeted “caregiver amount,” which is a nonrefundable credit of up to just under \$4,200 annually that a taxpayer can receive in respect of a close relative who is dependent on the taxpayer, if the dependant has a relatively low income. The projected cost of this provision to the federal treasury in 2009 was only \$85 million.

In the context of this study, all but the last two of these tax provisions are generic in the sense that they are focused not on caregiving explicitly but on putting or leaving money in the hands of seniors or retirees, thus making it easier for them to purchase what they need, including care services. The fact that the current Conservative government has enriched these generic provisions by allowing for pension income-splitting and a doubling of the age amount suggests that its policy strategy has become increasingly focused on a demand-side approach. It is also a middle-class strategy, since essentially none of these credits is refundable (that is, they are of no value to low-income families and individuals who do not pay federal income tax), and they therefore do not help the poorest of the elderly.

While at first glance these tax expenditures, totalling about \$5 billion annually, may seem significant, they pale in relation to the \$60 billion annually in direct expenditures on public pensions and the more than \$40 billion of private pension income derived from registered savings vehicles.

In summary, the federal government has a major impact on the demand side of the care system, even though its policies have not been established for that purpose. For all the big-ticket expenditures — and some of the smaller ones — in the retirement income system, federal policy has not been designed with reference to probable care needs. Indeed, in a retirement income system that directly and through tax assistance provides roughly \$100 billion of income annually to Canadian seniors, perhaps 1 percent can be thought of as having some direct link to the

demand side of caregiving. Yet, regardless of intent, Ottawa's policies have a large influence on the size and distribution of the demand side of the care system for the elderly.

As for the supply side, historically the federal government has played at best a marginal role. (It may have had some indirect effect through the matching grant provisions of the Canada Assistance Plan [CAP], which will be discussed below, but with the disappearance of CAP in 1995, any such influence ended.) As with the demand side, the tax expenditures that currently target the supply side equal less than 1 percent of federal outlays for retirement income.

With regard to the effects of these federal programs on the federation and on intergovernmental relations, one should bear in mind that while in the case of old age pensions Parliament has the explicit constitutional authority to legislate, provincial law prevails if there is a conflict between the two orders of government. In this sense, Ottawa's spending and tax expenditure programs for the current retired population are not coercive toward the provinces/territories. Indeed, apart from the intense intergovernmental negotiations in the 1960s that resulted in the CPP and the parallel QPP, the provinces/territories have generally looked to Ottawa to provide leadership in this area.¹⁹ This may be in part because the federal government has operational responsibility for public pension programs, but it is also because it has to concur with the provinces on CPP amendments.

Future retirees: Impact of the retirement income system

The federal government has thus had a major indirect impact on the demand side of the care system for current retirees, and the situation can be expected to be the same for future retirees. The benign effect of federal retirement income programs on intergovernmental relations could remain unchanged as well. This is because the federal programs that underpin the incomes of all but the oldest of the current elderly are the same ones that will underpin the incomes of the future elderly. The CPP and the QPP are now mature programs and, in relative terms, their future growth will be linked mainly to population aging. The OAS and the GIS are not funded contributory schemes, and the statutory commitment to maintain the income they provide relative to wage growth is weaker than that for the CPP/QPP. But over the decades Ottawa has acted periodically to keep the real value of GIS benefits stable relative to wage growth (an easy task in recent years given the absence of real wage increases). In fact in the 2011 budget the government announced modest increases in the GIS. The key point here is that the federal government is acting within its constitutional powers in all of these programs, which accounts for the benign intergovernmental relationship.

There are two reasons to think that this amicable relationship could change. The first is that over the past few years some of the weaknesses in the retirement income system have become more transparent. For people who were near their planned date of retirement when stock markets tumbled in late 2008 (as a result of the international financial crisis), and who had been saving for retirement through RRSPs or defined contribution pension arrangements, their vulnerability to the vagaries of the market became all too apparent. Deficiencies in supervision of defined benefit plans caused adverse effects on others when the pension plans of failed companies were terminated without sufficient assets to meet liabilities. At the same time, the low

interest rates that have now prevailed for some time are having a drastic effect on the living standards of those seniors who draw a substantial portion of their retirement income from the interest on bonds and guaranteed income certificates.

These difficulties led some provinces to launch discussions with Ottawa with a view to enlarging the CPP. In 2009 the Council of the Federation “called on the federal government to host a national summit on retirement income” (2009). In December 2010 six provinces requested that Ottawa “keep a modest CPP enhancement on the table as part of a package of reforms that would make saving for retirement easier, more affordable and more secure for Canadians” (British Columbia 2010). These provinces still appear to be interested in pursuing this idea, although the federal government and the other four provinces are seemingly less enthusiastic. In any case, if current concerns about declining RPP coverage and use of RRSPs and the difficulties with pension regulation are not addressed, the role of the CPP/QPP could be revisited (Ferley, Janzen and Onyett-Jeffries 2010; Baldwin 2011; Wolfson 2011). In such a scenario, intergovernmental tensions could arise due not to Ottawa intervening in provincial jurisdiction, but rather to provinces/territories pressuring the federal government to do more in an area of shared jurisdiction.

The second potential source of tension is the near certainty that rising care costs will put a strain on the budgets of the provinces/territories, causing them to pressure the federal government to help by transferring fiscal resources or otherwise absorbing part of the growing costs of care for seniors. This source of tension is of course linked to the first. If the deficiencies in the retirement income system prove to be more than transitory, the provinces/territories will be under even more pressure to increase their financial support of the care system.

The federal spending power

The federal spending power is the main instrument Ottawa has used to provide assistance to the caregiving community. Historically, the most significant of its initiatives was the *Canada Assistance Act, 1966*. It authorized the federal government to enter into bilateral agreements with provinces to cost-share social assistance and social services on a 50-50 basis, provided that the assistance and services were for people “in need.” The initiative for CAP rested as much with the provinces as with Ottawa or more so (Osborne 1985). CAP was an improvement over the three categorical matching grant programs that preceded it. All provinces signed agreements with the federal government, which effectively left them free to define “need” as they saw fit, subject to commitments on interprovincial mobility, an appeal procedure and the requirement that the delivery agent of provincial programs be the province, a nonprofit agency approved by the province or a municipality. Ottawa’s basic role was to verify that expenses claimed by the provinces as eligible for cost-sharing were indeed eligible.

Seniors were not major beneficiaries of CAP. Relatively few persons aged 65 and over were considered in need, since federal GIS benefits generally assured them a higher level of income than that provided by provincial social assistance. As for CAP’s role in respect of services, this depended on provincial priorities. Given the age structure of the Canadian population in the 1960s and the fact that governments’ attention at the time was focused on establishing or

developing medical insurance, post-secondary education and the retirement income system, care for seniors could not have been a priority for social service ministries.

Nonetheless, even though cost-sharing programs for seniors were but a small part of CAP, it was the main federal program for that purpose. Thus, Sherri Torjman points out that CAP created a “national legislative base for the support of social services,” including “essential support to help seniors and persons with disabilities to live independently in communities” (1997, 3). Yves Vaillancourt argues that CAP had a steering effect, in two ways: its cost-sharing provisions created incentives for Quebec and other provinces to focus their care policies on low-income families, possibly to the detriment of the middle class; and over time, CAP rules relating to delivery agents encouraged the growth of the third sector in Quebec, possibly at the expense of for-profit businesses (Vaillancourt 2003).

In terms of federal-provincial relations, it is safe to say that CAP, in and of itself, was relatively unobtrusive and less contentious than other matching grant programs of its era. But it was one of several federal matching grant programs introduced in the 1960s and, as we have seen, opinion was divided in the federation about the political legitimacy and, in the eyes of some, the constitutionality of using conditional grants to influence areas of provincial legislative competence under the Constitution (Tremblay 2000; Quebec 1998; Noël 2000a).

To address this concern, the federal government undertook not to introduce further programs of this ilk, and Parliament enacted the *Established Programs (Interim Arrangements) Act, 1965* to remove some of the irritants of the conditional grant approach. This statute authorized Ottawa to enter into agreement with any province with which it had a cost-sharing arrangement, to enable that province to receive the federal share of costs in respect of certain established programs in the form of tax points instead of money. While opinions differ about the significance of this provision, at the time it enabled the federal and Quebec governments to deal with a political crisis in a manner that allowed both to claim satisfaction with the outcome (Kent 1988, 296; Vaillancourt 2003, 161). As is well known, only Quebec took up the tax-point offer at that time.

The 1977 fiscal arrangements saw the merger of federal transfers for hospital and medical insurance and post-secondary education into the new Established Programs Financing (EPF) block fund, with part of the federal contribution paid for in the form of a tax-point transfer. The 1995 federal budget merged CAP and EPF into the new Canada Health and Social Transfer (CHST) block fund. The CHST was subsequently, in 2003, decomposed into the Canada Health Transfer (CHT) and Canada Social Transfer (CST), both block transfers. In fiscal year 2011-12, the CHT and CST cash transfers will total \$27 billion and \$11.5 billion, and they are legislated to grow by 6 and 3 percent annually, respectively, until 2013-14.

Often neglected in the recounting of this history is the fact that the 1977 fiscal arrangements included a new program to cover extended health services such as nursing home intermediate care, low-level residential care for adults, health aspects of home care and ambulatory health services not covered in the federal-provincial hospital insurance agreements. The payment

consisted of a per capita amount and an escalator. This was not all “new money,” in that the Extended Health Care Services program replaced some services previously provided for under CAP. This arrangement is noteworthy in that the federal government explicitly took on a funding role in relation to provincial care programs. Extended care was rolled into the CHST in 1996, and thus disappeared as a separate program.

So, what does this familiar history say about the current federal role in caregiving through intergovernmental transfers? With the end of matching conditional grant arrangements and extended care, there no longer is a federal instrument that serves as an incentive for the provinces/territories to build up their care systems.²⁰ In fact, without the matching grant, there is no link between the CST and provincial care programs for seniors. Once received in provincial/territorial treasuries, the federal transfer dollars become fungible.

The federal spending power can also be used to transfer payments directly to organizations for the purpose of providing care to seniors. The evidence suggests that this option is not being seriously pursued. Human Resources and Skills Development Canada (HRSDC) currently administers New Horizons for Seniors, which acts as a clearing house for issues and ideas that pertain to caregiving, serves as an advocate for caregiving within the federal government, helps run the live-in caregiver program and transfers small amounts of money to community organizations that support a range of community-based initiatives to address social issues and barriers faced by people with disabilities (HRSDC 2009). The government announced in the 2011 budget that it was enhancing the New Horizons for Seniors Program with \$10 million over two years to support projects that ensure seniors contribute to and benefit from activities in their communities (Finance Canada 2011).

Family members of the seriously ill and dying: Compassionate leave

In 2003 the Liberal government of Jean Chrétien amended the *Employment Insurance Act* to authorize the payment of benefits to EI contributors for compassionate leave of up to six weeks to care for seriously ill relatives. To be considered seriously ill, a person must be “at risk of dying within 26 weeks,” as attested to by a physician. The benefits are aimed at caregivers involved in providing direct care, giving psychological support or arranging for care by a third party. Compassionate leave claimants in 2008-09 numbered just over 5,800. In total they received \$9.9 million in benefits. This is a tiny program relative to retirement income programs and tax expenditures.

From a federalism viewpoint, this initiative is similar to the maternity benefits and parental leave provisions, whose constitutionality was challenged and which, notwithstanding their social policy content, were ruled constitutional by the Supreme Court.²¹ There is little reason, therefore, to think the courts would view compassionate leave benefits differently. Thus it is appropriate, within the federalism classification system, to view this program as nonhierarchical, since it entails the federal government legislating in an area where it has constitutional authority.

The broader public: Soft instruments

All of the above federal policies, which entail legislation, regulation, spending or tax expenditures, can be viewed as *hard* policy instruments. The federal government also uses *soft* instru-

ments, by commissioning reports, communicating information and research, and creating advisory bodies that may influence caregiving policies over the medium and long terms. The National Advisory Council on Aging is one example of a soft instrument. Established in 1980, it is mandated to assist and advise the minister of health (responsible for seniors) on all matters related to the aging of the population and seniors' quality of life. It issues periodic reports on matters of importance, but has little influence on federal policy. Its effects on the federal-provincial/territorial relationship are thus of no consequence.

The federal government also makes extensive use of task forces and commissions to structure debate on key issues. The reports of the Commission on the Future of Health Care in Canada (2002) (Romanow Report) and the Senate Standing Committee on Social Affairs, Science and Technology (2002) (Kirby Report) raised the profile of home care and caregiving. Regular reports from Statistics Canada on the country's demographic trends more or less draw public attention to the emerging care needs of our aging society. Such soft instruments may be influential in the long run, helping to inform and structure the debate, even if they seem to have little impact in the short run. In themselves, they have not been significant sources of tension in the federation.²²

Impact on federalism

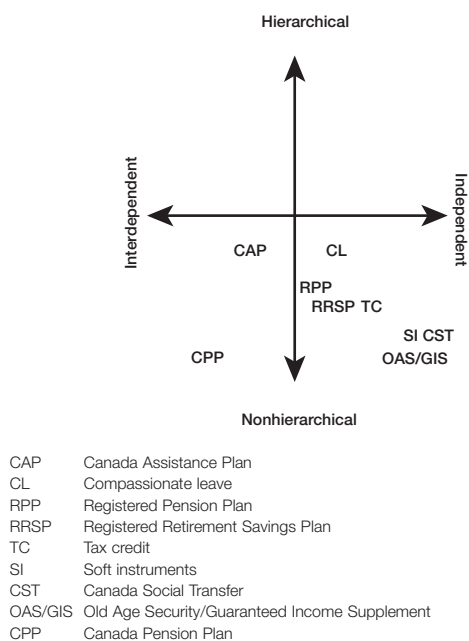

What kind of intergovernmental regimes do these various federal programs represent? How do the programs compare in terms of their potential effects on the federation? Figure 2 summarizes the analysis.

All of the federal programs are nonhierarchical, with the great majority falling in the classical federalism quadrant. Given the benign effects that programs below the horizontal axis have on intergovernmental relations, it is no surprise that current federal programs that have an impact on caregiving are not a serious source of intergovernmental tension — either because they allow governments to act independently of one another or because their interdependence is well managed.

The programs that have involved the provinces with the federal government are the CPP/QPP and CAP. The CPP can, by law, be amended only with the agreement of the government of Canada and two-thirds of the provinces representing a minimum of two-thirds of the Canadian population. This puts the CPP into the lower left quadrant: collaborative federalism. Efforts made by all governments to maintain parallelism between the CPP and the QPP are also collaborative.

In the days of CAP, there was considerable federal-provincial interdependence, if only because the provinces designed and delivered programs while Ottawa paid half the freight and audited provincial spending. On policy matters, including social services such as caregiving, the federal government did not meddle. In any case CAP no longer exists, and its putative replacement, the CST, is at best a distant relative. The difference between the CST and CAP from a federalism viewpoint is shown in figure 2. CAP was a collaborative, province-friendly program. The CST is even friendlier, given that it allows the provinces and territories to use CST funds as they choose. The CST fits into the classical federalism quadrant.²³

Figure 2: Forms of federalism in federal programs that influence seniors' care

In the case of the OAS/GIS, the tax incentives for RPPs and RRSPs, and the various tax credits, Ottawa acts independently of the provinces/territories.²⁴ These federal programs therefore fall into the classical federalism quadrant. The tax credits under the *Income Tax Act* are within federal constitutional competence, and Ottawa acts in this sphere wholly or largely independently of the provinces/territories when it uses this power. RPPs are also in the classical federalism quadrant. They are placed very close to the vertical axis only because the treatment they receive under federal tax law is, in the majority of cases, linked to the plans being registered under provincial law for regulatory purposes. But in fact there is little interaction between the federal and provincial administrations, as each has a distinct regulatory role.

The compassionate leave program is also close to the vertical line, since it is likely that a family facing the circumstances that make it qualify for these benefits will also be interacting with provincial/territorial social services agencies.

Finally, the way in which the federal government uses soft instruments is within its constitutional authority. And it uses them largely independently of the provinces/territories.

Summary

The federal government has implemented programs that have potentially influenced the caregiving field in recent years, and in a fashion that does not interfere unduly with provincial constitutional competence. The words “have potentially influenced” caregiving have been carefully chosen. The dollar amounts associated with these programs are in the tens of billions. In no way, however, do the larger programs focus explicitly on caregiving; they simply provide money to seniors that can be used for that purpose. As for the federal transfers to the provinces, even under CAP and extended health care, these never involved the federal government in deciding how much the provinces should or could spend on caregiving or the design features of provincial caregiving programs. And with the demise of these two programs, the federal government broke all links between the funds it transfers to the provinces notionally for social services, including caregiving, and how the provinces use those funds.

In a sense, the benign impact that federal policies have had on intergovernmental relations is not surprising. Ottawa effectively recognizes the constitutional role of provinces/territories in caregiving and has not, by and large, participated directly in this sphere of activity. In spite of this, it has had an influence through its large retirement income programs, which have helped

to shape the demand side of caregiving. From a federalism perspective, the demand side of the caregiver market is much less susceptible to intergovernmental tensions than is the supply side.

For those who attach primacy to the Constitution and the importance of harmonious intergovernmental relations, this is what they would expect to see. They prefer that the federal authorities not meddle in provincial/territorial legislative jurisdiction. Implicit in this position is that they would expect the provinces and territories to continue stepping up to the plate and to introduce and implement care policies as necessary.

For those who focus more on public need than on the niceties of the Constitution and expect Ottawa to lead in the event of a Canada-wide social challenge, the federal caregiving policy cupboard must look bare. This is simply because the federal government has in fact no real policy that impacts *directly* and *purposefully* on caregiving, beyond its tiny compassionate leave program and its few tax credits (the eligible dependant credit; the caregiver tax credit; and tax support for home-based caregivers and for medical and disability-related expenses). The federal government announced an additional family caregiver tax credit in the 2011 budget — a 15 percent nonrefundable credit on an amount of \$2,000 to provide tax relief for caregivers of infirm dependent relatives. The 2011 Conservative Party platform estimated the costs of this additional initiative at \$160 million annually — which indicates that this credit will make little difference to the lives of most caregivers.

Federal Policy Options for Light and Intermediate Care

Before presenting the policy options available to the federal government, it is worth noting one of the reasons for making a distinction between options for light/intermediate care and those for prolonged, complex care. Since many seniors require light or intermediate care at some point in their later years, it is reasonable to expect people to have anticipated some of these costs and to have saved during their working years for this purpose. Put differently, some of the options related to light and intermediate care place the onus on the individual, whereas, for reasons explained below, all of the options aimed at the heavy end of the care continuum depend mainly on the state. For those concerned about the overall private-public balance in retirement-related programs, this may warrant extra consideration of the private options for light and intermediate care.

Policy options for the light and intermediate points of the care continuum are presented first. They include both demand- and supply-side measures. Here, the range of options includes continuing with established programs, variations on these and some new ideas. They all anticipate a growing need for care, but they do not specify dollar amounts except for illustrative purposes.

Clearly, some of the policies I have laid out below are not priorities today. But these options are not straw men. They are set out to help explore alternative strategic approaches, using both a federalism lens and a broader policy perspective that includes familiar policy criteria like equity and efficiency. The objective is to encourage the federal government to think strategically about the range of policy choices that are possible looking to the future. The options are presented in table 2 and discussed in turn below.

Table 2: Policy options for light and intermediate care
<p>Demand-side options</p> <p>Option 1: OAS/GIS care supplement Option 2: CPP care supplement Option 3: Supplementary-care-benefit-for-persons-with-disabilities legislation Option 4: Registered care savings plan Option 5: TFSA expansion</p>
<p>Supply-side options</p> <p>Option 6: Grants to NGOs to build up local caregiving capacity Option 7: Refundable tax credit for caregiver respite expenses Option 8: Refundable tax credit for informal caregivers Option 9: Federal matching capital grants for provincial/territorial investment in care infrastructure</p>
<p>Combined demand- and supply-side options</p> <p>Option 10: Federal block fund for provincial/territorial care programs Option 11: Federal matching grants for provincial/territorial care programs</p>

Demand-side options

Option 1: OAS/GIS care supplement

This option would enable OAS/GIS recipients to qualify for a supplement to their current benefits if their care costs exceed some modest deductible — say, \$500 annually for someone eligible for the maximum GIS and \$1,000 to \$2,000 annually if they receive OAS only. The supplement would cover 100 percent of care costs in excess of the deductible for those receiving the maximum GIS, and the percentage of costs covered would gradually decline to zero as income increases. A ceiling of, say, \$5,000 annually would apply. In designing this benefit it would be important to avoid an overall tax-back rate that would be punitive (although since this measure would not

mainly be focused on workforce participants, incentive effects would be less of a worry than is the case for stacked programs for people of working age). The tax-back rate might also be more gradual for seniors living alone than for those with a partner, to reflect the probability that they would have less access to informal care. Like the OAS/GIS, the care supplement would be funded out of general revenues on a pay-as-you-go basis. It could also be implemented quickly.

One risk associated with this option is that provincial/territorial governments could increase the co-payments they require from people who are in long-term care residences or receiving other subsidized services in order to capture the federal supplement. Accordingly, consultations with the provinces and territories would be necessary before such a measure could be implemented. From a provincial/territorial viewpoint, it would simply mean that GIS recipients, and perhaps those slightly beyond that threshold, would have additional income to purchase services. Even without adjusting their co-payment rates, the provinces/territories would have fewer seniors to subsidize under this option.

The rationale for such a measure is threefold. While relatively few elderly couples' incomes are below the LICOs, a substantial number are only modestly above these levels, suggesting that they have little discretionary income, including for the purchase of care. Second, the problem is greater for unattached individuals who, because they lack a partner, do not have the financial benefit of sharing accommodation or immediate informal care support should the need arise. Finally, seniors who rely heavily on the OAS/GIS are also the most likely to require provincial/territorial subsidies should they need care. With this care supplement measure, far fewer seniors would have to plead their case with provincial/territorial officials; they would be more autonomous.

This option could also be delivered through the mechanism of a refundable tax credit under the *Income Tax Act*.

Option 2: CPP care supplement

Unlike the OAS and the GIS, which are linked antipoverty programs, the CPP and the QPP are intended to replace a portion of pre-retirement earnings. The benefits are very modest in size in that they replace only 25 percent of preretirement earnings, and only on earnings up to the national average wage (\$47,200 in 2010). The design of these public pension plans was premised on the assumption that, during their working years, people would also avail themselves of RPPs and RRSPs in order to have a retirement income sufficient to maintain their standard of living after retirement.

Like option 1, this option would put more money into the hands of seniors, contingent on their annual care expenses exceeding a deductible amount. But since the CPP is an earnings-related program, this care supplement would effectively target people with a stronger employment history than those targeted under the OAS/GIS option. As with the first option, the maximum supplement might be \$5,000 annually (adjusted by a wage index). It would be funded through mandatory increases in CPP contribution rates.

Unlike option 1, the CPP care supplement would not be income-tested. It would be earned and paid for by the beneficiary as a contingent entitlement in much the way that CPP contributors are entitled to a disability pension under certain conditions. In other words, it would become payable when the beneficiary begins to incur care costs and could be modelled on disability benefits (combination of base amount and a contribution-linked supplement). Since it takes many years of contributions to pay for and thus earn a full benefit in a contributory plan, another important difference from option 1 is that full benefits would not become available for decades (how many is a design detail with vast financial implications).

Returning to the theme of intergenerational equity, if the full benefit were to come into force when the legislation is passed, today's younger workers would have to pay higher contribution rates than are required to cover the costs of their benefits in order to compensate for older workers, who would have too few years to pay for their new benefits in full. The problem is that when today's younger workers are ready to retire, they cannot expect to receive similar support from tomorrow's younger workers. Given the current age structure of the population, it would be unrealistic to assume what was assumed when the CPP and the QPP were introduced in the mid-1960s, which is that older workers could qualify for full benefits after a 10-year phase-in without putting an undue burden on younger workers or those not yet in the workforce. The idea was that the working-age population would subsidize the retirement pensions of older workers in the expectation that the children of that working generation would in turn subsidize *their* pensions. It was not expected at the time that the birth rate would fall as dramatically as it subsequently did and eventually along with it the ratio of the population of working age to that of retirement age. It was also not realized how quickly the population would age. Based on current knowledge, a comparably rapid phase-in for a supplementary care benefit would be vulnerable to the charge that it is a Ponzi scheme.

Option 3: Supplementary-care-benefit-for-persons-with-disabilities legislation

Suppose the federal government wished to enact option 2 (CPP care supplement) but anticipated difficulty securing the necessary provincial approval for a CPP amendment. It could pursue the same policy outcome by using a different instrument. The same substantive supplementary care benefit as in option 2 could be enacted in separate legislation, referred to here as the “supplementary-care-benefit-for-persons-with-disabilities act.” The choice of name would make it clear that it was being enacted under section 94A of the Constitution, which reads: “The Parliament of Canada may make laws in relation to old age pensions and supplementary benefits, including survivors’ and disability benefits irrespective of age, but no such law shall affect the operation of any law present or future of a provincial legislature in relation to any such matter.”

As in option 2, this option calls for prefunding. Contributors would not earn a full benefit until some relatively distant future date, depending on the design. In this case, a new payroll tax would be levied and the money raised would be placed in a fund separate from the CPP Fund and the Consolidated Revenue Fund. Any province opposed to the legislation could take advantage of the provincial paramountcy provisions noted above and not participate. In that event the tax would not apply in the nonparticipating jurisdiction. Two mechanisms for non-participation are possible: opting in and opting out. Opting in means that the federal legislation would come into force in a province or territory only when that jurisdiction notifies Ottawa that its legislature has voted to participate. Opting out means that the federal legislation would apply in all jurisdictions unless the legislature of a province or a territory votes against participation. The opt-in procedure is more province-friendly. The opt-out procedure is more robust from a caregiving policy perspective.

At the federal level, an important question would be whether Ottawa would proclaim such legislation into force if only two or three provinces signal their wish to participate. In all probability it would not. But by proceeding in this way, it would be demonstrating that it is willing to accept a lesser measure of provincial consensus than the CPP amendment rule, which requires agreement from at least seven provinces representing a minimum of two-thirds of the Canadian population. The Social Union Framework Agreement (SUFA) rule for shared-cost programs requires only agreement from a majority of the provinces without stipulating a minimum share of the population, but this is not a shared-cost program. To amend most constitutional provisions a 7/50 rule prevails (that is, at least seven provinces representing at least 50 percent of the Canadian population must formally approve).

There is rich precedent for these opt-in/opt-out measures in the history of medicare. When Louis St-Laurent became prime minister in 1948, he inherited a Liberal promise of a comprehensive, publicly insured health care system, and there was a commonly held view that the first step in public insurance should focus on hospital insurance and diagnostic services. But he personally was not a supporter. In his second mandate, St-Laurent was cajoled by some of his ministers and some provinces to modify his position, but he dragged his feet. At a 1955 federal-provincial conference, St-Laurent stated that he did not consider it appropriate for Ottawa to impose taxes on all Canadians when only one, two or three provinces representing a distinct minority of Canadians were eager to proceed with hospital insurance. He went on:

“But if there were a substantial majority of provincial governments representing a substantial majority of the Canadian people who were prepared to embark upon provincially administered health insurance schemes,” then the federal government would play its role (Taylor 2009, 212). At the time, in 1955, such a “substantial” majority had not yet emerged. Hospital insurance legislation was introduced by the St-Laurent government shortly before the 1957 general election with a 6/50 rule. Although the Bill was enacted, it was not brought into force before the Liberals were defeated in the general election of 1957. When John Diefenbaker's Progressive Conservatives won office they introduced an amendment to drop the threshold from six provinces to five, and the legislation came into force.

When it came to medical insurance, the government of Lester B. Pearson took the opposite tack. It declared that once legislation had been passed, federal cost-sharing would begin, even if there was only one province ready to take advantage of Ottawa's matching grants.

In short, there is ample precedent for any of a number of rules. From an intergovernmental relations perspective, option 3 would acknowledge that the federal authorities lack the consensus to secure a CPP amendment but wish to move forward without that measure of support. In itself, that lack of provincial support would be controversial. This could be a minor and short-lived controversy, or it could flare up into a major flashpoint. The best way to minimize the risk and still proceed would be to adopt the opt-in process with something like a 6/50 or 5/50 rule. The legislation might not be promulgated for several years, but this is an issue for the long haul.

Option 4: Registered care savings plan

While RRSPs are disproportionately used by higher earners, this proposal would encourage modest-to middle-income earners to save for their future care needs. The registered care savings plan (RCSP) would be similar to an RRSP (providing tax deduction and shelter with taxes paid on withdrawals) and its deduction ceiling would be integrated with RRSPs and RPPs to limit maximum tax deductions. But it would differ from the RRSP in several important ways. First, the federal government would contribute directly to RCSP accounts, on an income-tested basis, up to \$5,000 to \$10,000 over the lifetime. These grants would be similar to those currently provided in conjunction with the Registered Disability Savings Plan (RDSP).²⁵ Second, withdrawals would be allowed only to cover eligible care costs. Third, the logical consequence is that RCSP accounts could remain intact until death, at which point the accumulated funds would be taxable as part of the estate of the deceased. This would not only enable the healthy plan participant to enjoy the benefits of sheltering the earnings of her account until a very old age, but also require her to do so.

For a contributor, the advantages would be the federal cash contributions and the longer tax shelter period relative to RRSPs. These advantages are intended to outweigh the disadvantage of less withdrawal flexibility. For the federal government, the objective would be to encourage people to better prepare for the financial costs of care. The hope would be that, by the time a person has “maxed out” on the federal cash contribution, saving for future care needs has become a habit. This approach would likely reduce the need for provincial/territorial subsidies for caregiving services, since seniors would be able to afford a larger share of the costs.²⁶

Option 5: TFSA expansion

The Tax-Free Savings Account (TFSA), established in 2009, is a new way for Canadians to set money aside tax-free throughout their lifetime. Contributions to a TFSA are not deductible for income tax purposes, but the initial amount contributed as well as the income earned in the account (for example, investment income and capital gains) is tax-free, even when the cash is withdrawn. The contribution limit is \$5,000 annually, indexed to the inflation rate. Option 5 consists of raising the TFSA limit significantly (to, say, \$7,500 or \$10,000) to help people save for the day when they will need extra money for care services or some other necessity.

This approach has three advantages. First, as noted above, there is a need to maintain a public-private balance in the retirement income system, and TFSAs could expand the private side. Second, TFSAs are a more advantageous way for modest- and middle-income earners to save for retirement than RRSPs and RPPs, mainly because the income they provide after retirement is not taxable and therefore not taken into account in determining eligibility for and the tax-back of OAS/GIS benefits (see Horner 2011).²⁷ Third, the TFSA is much more flexible than the RCSP. Its disadvantage flows from this flexibility: There is no guarantee that it will be used to purchase care services. The 2011 Conservative Party election platform announced the government's intention to raise the TFSA limit to \$10,000 annually once the federal budget is balanced.

To sum up, four of the demand-side options for light and intermediate care are within federal legislative authority. The fifth, the CPP care supplement (option 2), would necessitate an amendment to the *Canada Pension Plan Act*, which, as noted, would require the support of seven provinces and at least two-thirds of the population. If the CPP and QPP are to remain parallel, it would also be necessary to amend the *QPP Act*. The federal government could implement and administer all five options with little difficulty.

Supply-side options*Option 6: Grants to NGOs to build up local caregiving capacity*

The purpose of the grants would be to increase the number of caregivers. The federal spending power would be used to provide operating funds to nongovernmental organizations (NGOs) conditional on the NGOs using them to improve the supply of care services for seniors on either a nonprofit or a for-profit basis and according to various provincial/territorial certification and regulatory standards.

The NGO would not itself become a caregiving entity but rather would encourage new firms to enter the caregiving business by supplying information on local demand and supply of care workers, provincial/territorial occupational standards and training programs for care-related occupations. Where these don't exist, it would work with labour market partners to set standards and develop training programs. The NGO could also eventually act as an employment agency matching potential employees with caregiving jobs. With this kind of basic information provided at little or no cost, a significant start-up cost for small entrepreneurs would be subsidized.

For this option to have impact, the program would have to be larger than other grant and contribution programs run by the relevant federal department, HRSDC (HRSDC 2010a, 2010b). Yet if the program is very large, it would compete directly with the provinces/territories within their jurisdiction. Conversely, if it is small, it would risk irritating the provinces/territories while having little effect. An intermediate option would be to target a region in the province or territory where care services are in shortest supply. The grants might run for, say, three to five years while regional capacity is being developed. The selection of target regions would proceed in full consultation with the province.

To be effective, this option would also require a commitment from the provinces and territories that they will not reduce their caregiving expenditures as Ottawa ramps up its contribution (i.e., “no displacement”).

Option 7: Refundable tax credit for caregiver respite expenses

Informal caregivers play a huge role in today's care system for seniors, and as the population ages, the need for care providers will increase. Reports on informal caregivers consistently point to the lack of support and relief as an important source of stress and fatigue (see Keefe, forthcoming). The Canadian Institute for Health Information reports that about one-third of caregivers assisting a person with moderate to severe cognitive impairment feel distressed (CIHI 2010, 10).

The objective of this measure would be to make it easier for care recipients to hire a substitute caregiver while their regular informal caregiver is on leave. Under specified conditions, the care recipient would be eligible for a refundable tax credit for costs incurred. This would facilitate the caregiver taking time off for respite without fear of leaving the senior in the lurch. Note that this option is more appropriate for individuals requiring intermediate or complex care, as by definition persons with lighter care needs would not require as many hours of personalized care.

Eligibility requirements for this credit might include a condition that the unpaid caregiver has been providing care services regularly for a minimum period, perhaps as short as three months. The value of the credit could be calculated so as to enable the senior to purchase an amount of respite care equal to a percentage of the regular caregiver's work time.²⁸ For example, if the caregiver normally provides 100 hours of care monthly, then the credit would not exceed an amount equal to a fixed percentage of those 100 hours, perhaps somewhere in the range of 15 to 20 percent, multiplied by the hourly rate required to hire the respite caregiver. The source of funding for this credit would have to be worked out among the federal, provincial and territorial governments, but in principle the funds should come from Ottawa.²⁹

Option 8: Refundable tax credit for informal caregivers

The objective in this case would be to increase the number of informal caregivers substantially relative to the status quo. Based on current knowledge it is difficult to know how big an incentive would be required to make a difference and what the overall cost would be. Therefore it might be wise to test different models with pilot projects.

There are many design features that would have to be tested, but the idea would be to find the optimal level of incentive required to have a significant impact on supply, without doing prejudice to other parts of the economy. Since the paid labour force will be shrinking in relative terms as society ages, the incentive should not be so large as to create undesired labour market effects. The program might target individuals who have recently retired, those who have relevant experience but are not currently employed, and family members of care recipients. Eligibility would be restricted to those providing intermediate to complex care. The credit would also be income-tested. This is consistent with Kershaw's proposal to "enrich the existing caregiver tax credit and redefine it as a refundable caregiver credit" (Kershaw 2002, 1950).

This option overlaps with the existing caregiver credit and the eligible dependant credit. These two provisions offer tax relief to relatives providing in-home care. The existing tax provisions have been described as "but a 'symbolic gesture' in terms of valuing unpaid caregiving labour" (Canadian Centre for Elder Law 2010). The proposed credit differs from those provisions in two ways. It would be refundable. And there would be no requirement that the care recipient and the caregiver live in the same residence or be related to one another. Compared with the current caregiver measures, this option would be more expensive in terms of revenue forgone, but it would still be a relatively inexpensive way to reduce unmet care needs and it could reduce the need for more costly formal care. Finding more effective ways to support informal caregiving will become even more important in coming years, given the growing caregiver shortages that are anticipated.

Provincial governments have had their toes in these waters for some time, but without any sense of urgency. In 2009 the government of Nova Scotia announced the creation of what was reported to be the only existing direct allowance for family caregivers in Canada (Nova Scotia 2009). The Allowance to Aid Caregivers is an income-tested \$400 monthly benefit for eligible caregivers who perform 20 hours or more of care per week. The care recipient must be assessed as having a significant impairment. In 2010 the government of Manitoba announced the Primary Caregiver Tax Credit, an annual refundable tax credit that can be claimed by a person who is acting as primary caregiver without pay for a family member, friend or neighbour requiring level-2 care or higher under the Manitoba Homecare Program guidelines. The caregiver can claim \$1,275 a year per care recipient, for up to three care recipients (Manitoba 2010). Several other countries offer much greater financial support for caregivers than Canada (Canadian Centre for Elder Law 2010, chap. 6).

Option 9: Federal matching capital grants for provincial/territorial investment in care infrastructure

Since the shortage of caregivers and care facilities is expected to grow, the federal government could introduce a time-limited program of capital grants to the provinces and territories for the purpose of building up the supply side, both physical plant (e.g., more assisted living accommodation) and human capital (e.g., training programs for care workers).³⁰ The provinces and territories are responsible for managing the care system, and the most efficient way for Ottawa to promote growth of the supply side is to work with and through them. This approach would leverage federal money. The National Health Grants Program (1948-71) could be a model; it was also a 50-50 matching grant program. To ensure that option 9 serves its intended purpose, the grants would be applicable only to provincial/territorial spending that

is incremental to current or currently planned levels. This program would be developed collaboratively by the two orders of government in a manner consistent with the provisions of SUFA, which will be discussed further below.

Combined demand- and supply-side options

The next two options entail establishing a new federal conditional cash transfer to the provinces and territories to help them finance programs and services to address the growing care needs of seniors. The rationale for this approach is that the federal government can best advance its agenda for care by providing a specific-purpose grant to the jurisdiction that has responsibility for care programs. The federal government would seek to develop the seniors' care transfer in collaboration with the provinces/territories in a manner consistent with the provisions of SUFA. To the extent that the provinces/territories use the federal funds to subsidize more clients, this would support the demand side of care. To the extent that the funds are used to hire more caregivers or provide training for existing caregivers, the supply side would benefit.

Both options would require the following initial steps: (1) In consultation with each jurisdiction, establish the provincial/territorial per capita operating costs for seniors' care in a given base year; (2) determine the size of the federal transfer for year 1; and (3) decide on the growth formula to be applied to the transfer amount of year 1 in order to calculate the transfer amounts for years 2 and beyond. The escalation method is what distinguishes the two options.

The main question is, what determines the size of the federal transfer in year 1. In reality, there is no magic formula for establishing a "fair" amount based on some objective set of criteria. The year-1 transfer would have to be an amount that Ottawa judges sufficiently large to be accepted by the provinces/territories with its accompanying federal conditions. The main condition might simply be that the provinces/territories agree not to reduce their spending for seniors' care below the sum of their base-year per capita operating outlays plus the per capita funds received from Ottawa. The purpose would be to ensure that the new federal transfer is used solely for its designated purpose — to enhance care for seniors — otherwise the effect would simply be to shift federal revenues to the provinces/territories' consolidated revenue fund for other priorities. From Ottawa's perspective, the object would be to leverage its money for a growing social need. From the provinces/territories' perspective, a key issue would be whether the conditions attached to the transfer are so onerous as to outweigh the value of what could be seen as a windfall.

Option 10: Federal block fund for provincial/territorial care programs

The initial block transfer amount would be determined through negotiation, and in subsequent years escalated by a pre-established rate of increase not explicitly tied to provincial/territorial outlays. The escalator could be the rate of GDP growth or any indicator other than the actual increase in provincial/territorial spending to ensure that federal transfer increases are not driven by that spending. This would also avoid the need for Ottawa to audit provincial/territorial expenditures subject to some broad intergovernmental understanding about how to ensure that there is no displacement.

This operating grant would leave it to the provinces/territories to decide how to use the incremental federal funds within the seniors' care envelope, subject to a few conditions. Apart from a "no displacement" provision, the conditions could include mobility/portability provisions and an agreement to meet some minimum care standards negotiated by the two orders of government.

Option 11: Federal matching grants for provincial/territorial care programs

The only difference between options 10 and 11 is the escalator. In this case, the escalator would be a matching grant on all per capita expenses incurred by the jurisdiction above its per capita seniors' care expenditures in the base year. Thus, if a province/territory spends \$100 per capita in the base year and \$103 in year 1, the federal government would cover, say, half of the \$3 per capita increase.

Ottawa might prefer this escalator, because it would be an incentive for the provinces/territories to give higher priority to seniors' care programs (costing the jurisdiction only 50 cents for each dollar spent). Moreover, one traditional federal government objection to matching grants — that Ottawa loses control of its own spending — would have little relevance in this case. This would be a concern if Ottawa were providing matching grants on a large initial base, such as a province/territory's total social services or education budget. But addressing the care needs of seniors takes up only a small fraction of the budget of the social services or health ministry responsible for these services. Escalating this sum annually on a cost-matching basis would not jeopardize federal control of its overall budget. Also, since this would be a matching grant, it is assumed that Ottawa would put a cap on federal outlays.

If the federal government entered into such agreements with the provinces/territories, there would probably be a legal obligation to audit the jurisdictions' expenditures, to ensure that they are in fact eligible for cost-sharing. The provinces/territories, however, would likely prefer the block funding option because the 50-cent dollars would be seen as distorting their priorities, and because the audit provisions would be viewed as too intrusive.

Assessing the options for light and intermediate care

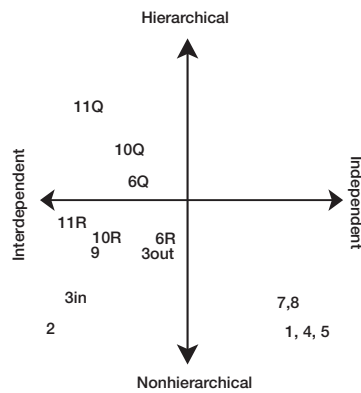

In this section, the policy options for light and intermediate care are assessed, first in terms of their probable effects on Canadian federalism — which is the dominant concern of this study — and second within a broader policy assessment framework.

This analysis leads to a few simple questions: Are there options that would not be irritants to the federation and to intergovernmental relations and that would also do well on the 10 policy criteria? If so, are there options on both the demand and the supply sides? Are there options that would appeal to a market-oriented, conservative government, a centrist government and a social democratic government?

Implications for federalism and intergovernmental relations

Figure 3 provides a snapshot comparative assessment of these 11 options as seen through a federalism lens. While the upper left quadrant is labelled "federal unilateralism" in figure 1, some might describe it as the "strong federal government" quadrant, in that the programs that

Figure 3: Policy options for light and intermediate care from a federalism perspective

Note: Q = Quebec; R = rest of Canada; out = opt out; in = opt in

the way in which each jurisdiction defines its own self-interest. If the federal government undertakes minimal consultation and then announces its proposal, knowing that only a few provinces/territories are interested, the effect on overall federal-provincial/territorial relations could be poisonous.

By contrast, if a process similar to that set out in section 5 of SUFA is followed — that is, both orders of government collaborate in identifying priorities, the federal government obtains the agreement of a majority of provinces before introducing the proposed shared-cost or block-funded program, and the two orders of government agree on an accountability framework — then the impact on intergovernmental relations would be less adverse and possibly even cause for celebration (Social Union Framework Agreement 1999). Nonetheless, there will almost always be at least one jurisdiction that does not want to participate in such an initiative yet is compelled to do so, because it would find it hard to explain to its population why they are paying taxes to Ottawa while a share of that money is not flowing back to their province or territory.

In the event that Ottawa undertakes a SUFA-consistent process, some provinces/territories would probably view options 10 and 11 as collaborative and welcome them. In contrast, based on previous reactions of Quebec governments to federal initiatives involving the spending power, it is virtually certain that Quebec would take strong objection to both options 10 and 11 — the only question is how strong (Noël 2000b). This is why in figure 3 these two options are shown for Quebec (“Q”) and for the rest of Canada (“R”). Depending on circumstances, one or two other jurisdictions might also resist Ottawa’s overture, due to different opinions about the nature of the federation, differences in provincial/territorial priorities and/or economic and fiscal conditions, or even political considerations.

Under SUFA, jurisdictions that are not part of the majority that has agreed to a new Canada-wide federal initiative but that “meet or commit to meet the agreed Canada-wide objectives and agree to respect the accountability framework will receive their share of available funding” (SUFA 1999, section 5). To understate the facts, for the nonagreeing provinces/territories this condition is not a high hurdle. At least in respect of larger federal transfers, it has been

fit into it are based on the idea of Canada as a sharing community. Option 11 (federal matching grants for provincial/territorial care programs) is identified as potentially the most coercive, because it would effectively require the provinces/territories to accept federal priorities in an area of provincial jurisdiction. In the case of the block fund transfer, option 10, the extent of coercion would depend on the conditions that are attached. Whether these two transfer options are in fact coercive would depend on the process followed by Ottawa in seeking provincial/territorial support and

decades since any jurisdiction did not receive its “appropriate” share of federal funding in a joint program.³¹ Thus, if Ottawa does proceed with either of these two options it is highly probable that Quebec would opt out and still receive its share of the funding.

SUFA is a political agreement between the government of Canada and the governments of all provinces and territories (at the time) except Quebec. It is not legally binding. After the agreement was reached, it dropped out of sight (Fortin, Noel, and St-Hilaire 2003). Political leaders virtually never refer to it publicly, perhaps because it was never accepted by Quebec. Nonetheless, its principles and the procedures it calls for are a good way to conduct intergovernmental relations. Since the 2004 federal-provincial/territorial Health Accord, under the Martin government and especially under the Harper government, there appear to have been few egregious transgressions of SUFA's broad principles.³²

At the same time, although the form and substance of intergovernmental relations embodied in options 10 and 11 have been common in post-Second World War Canada, they remain objectionable to the government of Quebec. Quebec holds the view that federal-provincial/territorial agreements that rest on the spending power are not consistent with the division of legislative powers as set out in the Constitution. Over the decades, Quebec governments of all political stripes — Liberal, Parti Québécois and Union Nationale — have argued that the spending power is a fiction and that it has no basis in the Constitution (Quebec 1998). As a result Quebec often opts out of joint programs or participates in an asymmetric fashion. In some cases it may hold its nose and participate. Whichever of these positions Quebec takes, the government of Canada ends up paying the government of Quebec its share of the federal transfer and there is usually considerable ambiguity in the public communications that follow, with Ottawa and Quebec each putting its spin on the outcome. In considering its strategy in respect of care policy for seniors, a big question for Ottawa is whether damage would be done to Canada-Quebec relations if option 10 or option 11 is pursued and, if so, how much damage. It could be a little, or it could be a lot.

Quebec is not the only jurisdiction to challenge the federal role in using the spending power. The government of Alberta has consistently questioned the legitimacy of this role since the time of the Lougheed premiership (Alberta 1978a, 14-15; Alberta 1978b, 78-81). Periodically, particularly when the Conservatives are in power (or, previously, the Progressive Conservatives), Ontario has taken the same position. The other jurisdictions are more interested in seeking controls on how the federal spending power is used, and in imposing some limits on Ottawa's discretion on “dis-spending,” perhaps through a constitutionalized, modified version of SUFA. Such a provision was included in the failed Meech Lake and Charlottetown accords.

The key message here is that the federal government could try to proceed with the cost-sharing arrangements in options 10 and 11 and adopt more or less openness and flexibility in the negotiating process. But it will always be important for Ottawa to be satisfied that it cannot reach its objectives in other ways. Would the benefits of implementing a new block fund (option 10) or matching grant (option 11) for seniors' care be worth the risk, in terms of the impact on intergovernmental relations and the state of the federation?

Returning to figure 3, option 9 (federal matching capital grants for provincial/territorial investment in care infrastructure) is shown well below the horizontal axis even though it, too, is a matching grant program. The provinces/territories are generally more open to matching-grant agreements that involve capital expenditures than they are to those that pertain to ongoing provincial/territorial operations. For one thing, matching grant agreements are invariably time-limited, which means that the federal presence will also be time-limited. As well, joint programs that are for capital investment purposes carry much less risk of Ottawa intruding in the daily program administration of provinces/territories than do conditional grants for operating purposes.

The options in the lower right (classical federalism) quadrant would enable the federal government to act independently of the provinces/territories. For example, option 1 (OAS/GIS care supplement) would entail incremental federal spending in an area in which Ottawa has the constitutional right to legislate, and it would not put pressure on the provinces/territories to change their priorities. Options 4 and 5 are income tax measures within federal jurisdiction. All three are demand-side measures. Options 7 and 8 are also tax measures, but they are aimed at influencing the supply of informal caregivers. While neither would be an intrusion into provincial/territorial affairs, both are located a little closer to the vertical and horizontal axes by virtue of the fact that they would intersect more directly with provincial programs than the demand-side measures.

Option 2 (CPP care supplement), which appears in the bottom left (collaborative federalism) quadrant, is highly interdependent and noncoercive because of two factors: the strict federal-provincial consensus formally required to amend the *CPP Act*, and the Quebec/rest of Canada political consensus to minimize differences between the QPP and the CPP.

Perhaps the most difficult option to assess for its effects on the federation is option 3 (supplementary-care-benefit-for-persons-with-disabilities legislation). From the viewpoint of policy substance, both the opt-out and the opt-in variants would allow a province/territory to not participate, in which case its residents would not be taxed to fund this benefit. Nonetheless, the optics would be different depending on which variant is chosen. If the law automatically applies to all provinces unless they opt out by having their legislatures vote on the issue, any province that is opposed would have to publicly stand up and declare its nonparticipation. If the opposition parties in the province do not share the government's view, the issue could readily become a problem for the government in question. If the legislation is drafted on an opt-in basis, it would be politically easier for the province that wishes not to participate. The opt-out and opt-in variants are shown separately in figure 3.

Option 6 (grants to NGOs to build up local caregiving capacity) would be less controversial and sensitive than intergovernmental transfer agreements, in part because it would not require matching grants from the province/territory. For Canada outside Quebec, the effect on intergovernmental relations would likely be small — it would likely prompt a mix of welcome, indifference and possibly mild irritation. On the whole, most provinces would welcome such

an initiative if there are meaningful consultations on the program design at the outset and on the selection of targeted regions once the program is up and running.

Based on historical precedents Quebec would likely object. The most famous precedent is the Duplessis government's opposition to a program of federal grants to Canadian colleges and universities during the 1950s. The province won the dispute in the political arena, and Ottawa agreed to transfer corporate tax room to Quebec in lieu of the direct transfers. Since then, Quebec has consistently opposed federal transfers to post-secondary institutions, including those for purposes such as adult education, training, continuing education and support for students (Quebec 1998). For the government of Quebec, the normal response to such an initiative would be that caregiving is under Quebec jurisdiction. If the federal government has enough money to be spending in provincial jurisdictions, this merely demonstrates that it has occupied too much tax room. The federal government should lower its tax take, so that Quebec (and any other province or territory that so desires) can increase its revenues while leaving the Quebec taxpayer neutral.

The grant program proposed here is on a significantly smaller scale, however, than the 1950s precedent was, and it would probably have a modest public profile. Thus, although Quebec would likely object, its objection might be tempered, or even pro forma, if it is able to exercise substantial influence over the region selected.

Since option 6 would require intergovernmental collaboration, it is located on the left side of figure 3. Quebec would view it as intrusive and an irritant but not coercive unless it is implemented on a large scale. Hence it is located above the horizontal axis, but only just. For the ROC it is located below the horizontal axis. Option 6 is on the margin, from a federalism perspective.

A broader public policy perspective

The 11 policy options for light and intermediate care have also been assessed against 10 policy criteria using a simple rating system that gives all criteria equal weight.³³ This assessment is presented in tabular form in appendix 1. The bottom row summarizes the ratings. The five demand-side options and three of the supply-side options (7, 8 and 9) were assessed as the best. These eight policy options were all assessed as “good” or higher on seven of the ten assessment criteria. In contrast, options 10 and 11 were rated as “fair” or “poor” on four criteria. Option 6 was rated “fair” or “poor” on seven criteria. Importantly, the three options that received lower ratings on the policy criteria all raised significant questions in my earlier discussion of their effects on federalism.

At this point it may be useful to recall that the purpose of this study is to form a view on how much freedom the federal government has in fashioning a policy strategy for seniors' care, not to propose an optimal care policy strategy. As was noted, from a federalism perspective options 10 and 11 are problematic and option 6 is at least suspect. If these three options had scored best on the 10 policy criteria, and if the eight options that are robust from a federalism viewpoint had scored very poorly on the policy criteria, the federal government would be heavily constrained.

But the opposite is the case. There are demand-side and supply-side options that do not raise red flags from a federalism viewpoint and that received positive policy assessments. The kind of federalism implicit in demand-side options 1, 2, 4 and 5 is benign. The opt-in version of option 3 is also respectful of provincial paramountcy and ought not to raise provincial hackles. Options 1 to 5 also scored well on the policy criteria. A federal strategy that includes one or more of them could thus be described as win-win (good federalism/good policy). Options 7, 8 and 9 are supply-side options that are also benign from a federalism perspective and were assessed positively on the policy criteria.

At this broad level of generality, two points emerge. For the light and intermediate points on the care continuum, there is scope for a federal policy strategy that is oriented to either the demand side or the supply side, or both. However, the range of choices is richer on the demand side, in part because the supply-side programs come closer to touching provincial jurisdiction. These conclusions are summarized in table 3.

The analysis can be taken a step further. Most of the policy criteria are mainly administrative constraints or factors that need to be considered. For example, governments would like to be confident that a new policy initiative can be delivered without high administrative costs and that the lines of accountability for outcomes are clear. But a federal strategy for seniors' care would not begin with an overriding objective of administrative efficiency or accountability. Economic efficiency, horizontal equity, mobility and political credit are other factors that would be considered in policy decisions but are unlikely to be overarching goals.³⁴

But the four other criteria could also be policy goals. A federal government could well have as a goal increasing personal autonomy for seniors who require care. Or it might be concerned about the legacy of this generation to its grandchildren. In this case maintaining intergenerational equity could be a goal. If the government wishes to focus on people who are most in need, ensuring target efficiency and/or improving redistributive equity could be goals.

The next question is whether there are, among the eight options that do not raise federalism concerns, some that would advance these four goals. The answers are summarized in table 4. Personal autonomy is best supported by putting buying power into the hands of those who require care, rather than directing the same funds to provincial/territorial governments or NGOs. The reason is simply the old saw that "she who pays the piper calls the tune." All five demand-side options meet that test. They would increase the financial capacity of seniors, which better enables them to pay for the care services of their choice. Supply-side options, to the extent that they increase caregiving capacity and the choices available, can also enhance personal autonomy, but they do so only in an indirect way. While option 7 is designed to support informal caregivers by facilitating respite arrangements for them, it would operate mainly through the care recipient, and therefore it would also have direct personal autonomy benefits.

In the case of intergenerational equity, four of the five demand-side options would entail pre-funding and therefore would not add unfairly to the tax burden of younger people.³⁵ Option 1 (OAS/GIS care supplement), however, is pay-as-you-go (PAYGO) and would increase the

Table 3: Policy options for light and intermediate care that would foster good federal-provincial/territorial relations and that score well on the 10 policy criteria

Option	Type of intergovernmental regime	Type of option	Assessment from appendix 1
1. OAS/GIS care supplement	Classical	Demand-side	Excellent 7 Very good 1 Good 1 Poor 1
2. CPP care supplement	Collaborative	Demand-side	Excellent 5 Very good/excellent 1 Very good 1 Good/very good 1 Good 1 Fair 1
3. Supplementary-care-benefit-for-persons-with disabilities legislation	Collaborative (opt in)	Demand-side	Excellent 6 Very good/excellent 1 Good/very good 1 Good 1 Fair 1
4. Registered care savings plan	Classical	Demand-side	Excellent 3 Very good 3 Good/very good 2 Good 1 Fair/good 1
5. TFSA expansion	Classical	Demand-side	Excellent 4 Very good 1 Good 2 Fair/good 1 Poor/fair 1 Poor 1
7. Refundable tax credit for caregiver respite expenses	Classical	Demand-side	Excellent 3 Very good 3 Good/very good 1 Good 3
8. Refundable tax credit for informal caregivers	Classical	Supply-side	Excellent 2 Very good 3 Good/very good 2 Good 2 Fair/good 1
9. Federal matching capital grants for provincial/territorial investment in care infrastructure	Collaborative	Supply-side	Excellent 1 Very good/excellent 1 Very good 3 Good 2 Fair/good 2 NA 1

tax/debt burden on today's workforce, especially the younger cohorts, and increasingly so as the population ages. Supply-side options that increase the number of care providers for today's seniors would entail a transfer from today's younger taxpayers (though seniors also pay taxes), while those that increase longer-term care capacity (for example, by building new assisted living facilities and training future caregivers) would probably also benefit them at some point in the future (option 9).

Table 4: Policy options for light and intermediate care that are compatible with four care policy goals

Policy goals	Demand-side options	Supply-side options
Personal autonomy	1, 2, 3, 4, 5	7
Intergenerational equity	2, 3, 4, 5	9
Target efficiency	1, 2, 3, 4	7, 8, 9
Redistributive equity	1	7, 8

Target efficiency can be defined in several ways. Under a broad definition that aims to provide public resources where they may be needed, all the options would work. However, under a narrow definition that aims to ensure that money is spent exclusively on seniors' care, only options 1, 2, 3, 4, 7, 8 and 9 would fit that bill.

As for improving redistributive equity, options 1, 7 and 8 would achieve that goal by design, whereas option 2 and 3 could be used for that purpose by adjusting the contribution/benefit rate structure accordingly.

These points are captured in table 4. What is important to note here is that there are both demand- and supply-side policy options that are consistent with all four goals. These goals are sufficiently different from one another that some could appeal to a market-oriented conservative government, others to a social democratic government and still others to a government of the centre. In a nutshell, at the light and intermediate points on the care continuum there is a full range of policy initiatives available to the federal government that would be compatible with good intergovernmental relations and good public policy. For a federal government of almost any political stripe, therefore, there are opportunities to improve seniors' care.

Federal Policy Options for Prolonged, Complex Care

This section deals with policy options at the heavy end of the care continuum (table 5). As noted earlier, the considerations that apply here are substantially different than those that apply at other points on the continuum. The term "heavy" as used in the context of this study is not intended to replace the more conventional term "complex."³⁶ The type of care required at this end of the continuum is indeed complex, due to the presence of multiple disabilities and the need for professional supervision and personal assistance, sometimes around the clock. The term "heavy" is meant to convey the idea that most individuals who spend an extended period of time in complex care incur costs that are beyond their financial reach. A person who receives complex care for six months and then dies has experienced a substantially different financial burden than a person who is in complex care for years.

The policy options to address light and intermediate care needs involve both the private and the public sectors. In this section, only public sector options are suggested. The reason is simply that it is unrealistic to base policy on the expectation that individuals should and will be able to provide for themselves in the unlikely event that they need costly, complex care for a lengthy period of time at some point in their life. This would require that most people oversave to the point that they would have a much higher standard of living after retirement than they did in their working years.

Table 5: Policy options for prolonged, complex care
<p>Demand-side options</p> <p>Option 12: Income- and asset-tested catastrophic care costs benefit</p> <p>Option 13: Contributory insurance against catastrophic care costs</p> <p>Option 14: Provincial/territorial coverage of catastrophic care costs through federal legislation and transfers</p>
<p>Supply-side options</p> <p>Option 15: Refundable tax credit for caregiver respite expenses</p> <p>Option 16: Refundable tax credit for informal caregivers</p> <p>Option 17: Federal matching capital grants for provincial/territorial investment in complex care infrastructure</p>
<p>Combined demand- and supply-side options</p> <p>Option 18: Federal block funding for provincial/territorial complex care programs</p> <p>Option 19: Federal matching grants for provincial/territorial complex care programs</p>

Social insurance is the way in which public policy deals with a situation where there is a relatively low probability of incurring high costs by pooling risk over a larger group. Social insurance is often defined as including only those programs in which all or the bulk of the funding is raised through mandatory earmarked employer and employee contributions that are paid into a fund that is segregated from other government finances and from which benefits are paid. The definition adopted here is broader. It includes any government program that spreads the risks of an uncertain future over all of the taxpaying public. This avoids a long discussion of exactly where the

cut-off points are for the purposes of satisfying the more conventional definition.

There are many types of social insurance programs in Canada, each with its advantages and disadvantages. Some programs, such as Employment Insurance (EI), are paid for through earmarked taxes and others, such as medicare, mainly through general revenues. Some are funded (the CPP and the QPP are partially funded), others are PAYGO (the OAS and the GIS). Social insurance can be provided through either income support or service programs. In the case of income support programs, participants are entitled to benefits when certain contingencies materialize, as is the case with EI, Workers' Compensation, the CPP, the QPP, the OAS and the GIS. Public health insurance is the largest service program in each province, and thus the largest in Canada. It is a social insurance program in the broad sense in that society covers the cost of medical, hospital and many diagnostic services, partly from provincial revenues and partly from federal revenues through the CHT.

Social insurance programs can operate at either the provincial/territorial level or the national level. A disadvantage of social insurance that is provincial rather than national is that it limits the size of population over which the pooling of risk occurs. This would be an important issue for the less populous jurisdictions in particular. Also, in the absence of a pan-Canadian program, regional differences in public coverage and access to care services could become a factor in seniors' decisions about where to reside. This in turn could lead some provinces to impose residency requirements. In the case of seniors' care, for instance, some provinces (notably British Columbia) are consistently net receivers of older migrants from other provinces and territories, while others are net "exporters." Thus, there is a case to be made that all of Canada should be the sharing community for catastrophic care costs and, therefore, that Ottawa should assume a leadership role in shaping strategic policy to that effect.

A federally financed social insurance program for catastrophic care costs could be attractive to both orders of government. It would relieve the provinces/territories — sooner or later, depending on details of the program design — of the growing cost of subsidizing those seniors who have the greatest care needs. And it would do so without undermining the provinces/

territories' exclusive authority to make laws relating to the protection of care recipients, the certification of care professionals, the approval of group residences and other care-related responsibilities. What might be appealing for Ottawa is the fact that this would entail a national project that addresses an important societal and fiscal challenge in an equitable (again, depending on the details), economically efficient and fiscally responsible fashion. The challenge in considering such options is whether they can be designed in a way that meets the insurance objective without sideswiping provincial/territorial care programs.

Three categories of demand-side options are discussed in this section, reflecting Canada's diverse experience with different kinds of social insurance programs. The first two involve federal transfer payments to persons incurring catastrophic care costs, one on a PAYGO basis and the other on a fully funded basis. The third category entails new services delivered by the provinces/territories on a PAYGO basis, with additional funding from Ottawa. Federal transfers to provinces and territories (block fund and matching grants) for operating expenses related to catastrophic care costs are also considered. Analogous to options 10 and 11 above, these transfers would leave it to the provinces and territories to decide whether to use the funds to support the demand side, the supply side or both.

Demand-side options

The demand-side options involve federal payments to and for seniors whose eligible expenses exceed some definition of catastrophic care costs.

Option 12: Income- and asset-tested catastrophic care costs benefit

This option would consist of a noncontributory benefit for persons who, after reaching age 65, incur cumulative care expenses that exceed a defined threshold of catastrophic costs. All eligible expenses beyond the established threshold would be paid for, although benefits would be income- and asset-tested. The benefit would be paid out of general revenues and provided as a refundable tax credit, which means it would also be available to those who do not have enough taxable income against which to offset the benefit. While this study does not include program design details, the data below give some idea of the range of care costs involved.

The costs of long-term care facilities for residents vary by province and depend on whether they are publicly subsidized or entirely privately paid and on the type of accommodation (standard, semiprivate or private). A 2009 study by the Canadian Union of Public Employees found that in publicly subsidized facilities the annual cost to residents ranged from roughly \$12,000 to \$36,000 (2009, 22). It also found that the average rent in unsubsidized for-profit private-pay facilities in six provinces ranged from \$30,000 to \$60,000 annually, even though these facilities provided a lower level of care than the subsidized ones.³⁷ Given that the median annual after-tax income of those aged 65 and over in 2007 was \$21,300 for single women, \$23,400 for single men and \$44,900 for couples, it is clear that private facilities are beyond the means of a large majority of seniors. According to a study by the National Union of Public and General Employees, most provinces apply a means or asset test as well as an income test for the subsidies they provide for seniors' care. In the Atlantic provinces and Quebec, "an individual must liquidate a percentage of the family's

assets, including savings and investments," before they can receive a subsidy (2007, 18). The remaining provinces except Alberta employ an asset test, which excludes family assets.

All of this suggests that in most provinces many current long-term care residents have already liquidated at least some of their assets. Indeed, as a result of income tests, long-term care residents in the four western provinces are typically left with a monthly income of \$200 to \$300, and considerably less in central and Atlantic Canada, to cover other expenses. It is also noteworthy that provincial governments and long-term care facilities often bump up their rates when residents receive pension increments. In a sense, therefore, the federal government is a party in a triangular financial relationship with elderly citizens and the provinces/territories, and this type of federal initiative would clearly intensify the dynamics of that relationship.

For the provinces/territories, a federal catastrophic care costs benefit would create an incentive to reduce if not eliminate subsidies to long-term care facilities and their residents. Whatever the federal threshold for defining catastrophic costs, the lower the provincial/territorial subsidy the sooner the federal program would be triggered. And ultimately, the lower the subsidy the greater the cost saving to provincial/territorial budgets. Indeed, a corollary of this option is that if the federal asset test is more stringent than the provinces', the federal benefit might never be triggered for those long-term care residents with "excess" assets. As for long-term care residents and others with heavy care costs, if they could find a voice it would argue that provincial/territorial income and asset tests leave them with too little money to pay their other bills. They would seek to retain a share of the federal benefit. The government of Canada would also have interests. One of these would be to make sure that the provincial/territorial increases in the amounts charged to long-term care residents (the subsidy reductions) meet some test of reasonableness. Federal ministers might also want to ensure that at least some of the federal money stays with seniors in order to gain some political credit.

Under this option the federal government would have to decide which expenses are eligible. It would need to determine when the catastrophic care cost threshold has been reached and also to make clear which expenses it would pay for beyond that threshold. Eligible expenses would likely include other expenses in addition to those charged by long-term care facilities. Some persons do receive their care and incur their costs at home. Those who are in care facilities could have incurred eligible costs before they entered the facility. Also, there may well be non-insured health-related expenses.

Establishing federal eligibility rules raises issues about the interaction between the federal program and existing provincial/territorial care programs. The federal government could decide that its rules for establishing which categories of care expenses are eligible would parallel the rules that each jurisdiction uses for the purpose of determining eligibility for its own subsidy programs for care expenses. This would mean that the effective threshold for the federal benefit would differ from one jurisdiction to another, since subsidies differ from jurisdiction to jurisdiction. On the other hand, if Ottawa applies the same rules across the country, there would be two sets of rules within each province/territory, one for the purpose of determining if and when a person qualifies for the federal benefit and another for the purposes of provincial/territorial programming. This trade-off would not be easy to resolve.

The federal government has extensive experience in delivering income-tested programs and refundable credits, but not in asset testing. However, it does have some relevant experience, for example, in taxing estates and real estate gains. The assumption here is that for income- and asset-testing purposes it would be necessary for taxpayers whose care expenses exceed the threshold definition of catastrophic costs to provide income tax statements, including documentation on financial and real assets.

As noted above, an advantage of this scheme for the provinces/territories would be that Ottawa would effectively absorb some of the costs that they now pay in their capacity as payers of last resort. Would this advantage outweigh the complexity of having Ottawa engaged in overlapping programs that could have an impact on their own programs? If the result is two sets of rules in each jurisdiction, the provinces/territories might lose interest. In jurisdictions where the federal rate for eligible expenses is higher than the provincial/territorial rate (e.g., accepting as eligible expenses higher rates of pay for caregivers or higher rents in caregiving facilities), the provinces/territories might worry that formal caregivers and care facilities would try to lever rate increases from them, using the federal tariff schedule as a bargaining tool.

There appear to be two legislative routes for achieving the same outcome under this option. The first would entail amending the *Old Age Security Act*. Parliament would enact a supplement to the OAS/GIS for persons whose care expenses exceed some threshold. The second route would be through the income tax system and thus implicitly the spending power. Two questions arise in choosing between them. Is it more likely that a commitment made under the *OAS Act* would be shielded during one of Ottawa's periodic expenditure reviews than a comparable commitment made under the *Income Tax Act*? Would the choice of legislative mechanism influence the willingness of the provinces and territories to cooperate with Ottawa in making the catastrophic care costs benefit politically viable? Implicit in the second question is the judgment that this option would not be workable if it does not enjoy a degree of provincial/territorial support.

Whether it uses the *Old Age Security Act* or the *Income Tax Act* as its legislative tool, the federal government would need the support of at least a majority of the provinces/territories. This would be the case explicitly if the *Old Age Security Act* is employed, since a province would be able to exert its constitutional powers under section 94A to effectively override the federal program. If the same federal program is introduced under the *Income Tax Act*, the province could still block it by introducing legislation that would render it ineffective. But even apart from the legal considerations, the provinces/territories would almost certainly be able to discourage the federal initiative by refusing to cooperate in practical ways.

Consider a situation where, say, there is agreement from seven provinces with two-thirds of the population (the same as required for a CPP amendment), but only that degree of support. What would Ottawa do if the nonconsenting provinces passed legislation to keep it out? Assuming the federal government decides to proceed, this would mean that the federal benefit would not be available to residents in those three provinces, who, as federal taxpayers, would be effectively subsidizing the taxpayers in the other seven.

If the constitutional context were different, it might be appropriate for the federal government to take a hard stance and state that it is proceeding with its program and that it looks forward to the day when the three opposing jurisdictions join in. But the fact that section 94A makes it clear that provinces have paramountcy in respect of old age pensions and supplementary benefits suggests that the Constitution does not anticipate Ottawa playing tough with the provinces on those items.

In general, opting out is used for programs that involve federal transfers to governments, not to individuals or organizations. But there is a precedent for opting out in the case of university grants (1960) and youth allowances (1964). It could be appropriate in this kind of situation to avoid the cross-subsidization between federal taxpayers in participating and nonparticipating jurisdictions.

Option 13: Contributory insurance against catastrophic care costs

This is also a social insurance option to protect the small percentage of the elderly population faced with catastrophic care costs. It would entail the creation of a new “catastrophic care costs benefit” (CCCB) that would be available to any participant who incurs, cumulatively after age 65, eligible care expenses that exceed a defined threshold of catastrophic costs.³⁸

The CCCB threshold chosen would affect the cost of the program, but the assumption here is that it would be in the order of tens of thousands of dollars. Amounts of this magnitude are not out of line, given that in 2005 the median net worth of families aged 65 and over was in excess of \$300,000, higher than for all other age groups, except those in the 55-to-64 age bracket (half of whom would be over 65 by now). It is difficult to argue that cumulative care costs in the \$20,000-to-\$30,000 range would be catastrophic for the one-half of families that are at or above the median, or even for those that are slightly below the median.

This option differs from option 12 in two ways. It would be prefunded, whereas option 12 is PAYGO. This means that CCCB payments would not begin for many years, whereas under option 12 payments could start soon after passage of the legislation. Also, the CCCB would become payable when the threshold for catastrophic costs has been reached, without the income and asset tests imposed under option 12. The tests would not be necessary, because the contingent benefit would be fully funded.

As with option 12, the two orders of government would need to decide which care expenses are eligible. If Ottawa adopts the provincial/territorial rules for eligible care expenses in each jurisdiction, the effective threshold for the CCCB would differ from one jurisdiction to another and coverage would differ after the threshold is reached. On the other hand, if Ottawa establishes national eligibility rules, there would be two sets of rules within each province/territory, one for determining if and when a person qualifies for the CCCB and another for provincial/territorial programming purposes. This trade-off would not be easy to resolve.

Two mechanisms are available to achieve this. The first is through an amendment to the CPP; the second entails a separate disability care statute.

Option 13a: Contributory insurance against catastrophic care costs through CPP amendment

The CPP already includes disability provisions, and there are federal administrators familiar with the issues related to disability. However, given the stringent CPP amendment rule, the diversity of economic and social conditions among the provinces and the range of ideological perspectives among provincial governments, this route would be difficult to navigate politically. There is also the issue of whether Quebec would be willing to amend the *QPP Act* along the same lines. This explains why CPP amendments are rare.

A premise in this case is that the CCCB would be available to a cohort only to the extent that it has paid for the benefit. This is to ensure that younger members of today's workforce, and those who will join the workforce in the years to come, do not end up paying twice — for their own benefits and for a share of the benefits of today's middle-aged and older workers. If this premise is accepted, there are a number of ways of designing the contribution/benefit structure, each with advantages and disadvantages.

The first alternative would be to require only those under a certain age — say, 30 — to contribute to and ultimately be eligible for this benefit. This would have the advantage of ensuring that younger generations do not subsidize their elders. The disadvantage would be that the benefit would not be available for another 35 years, which does not fit well with the demographic considerations that gave rise to this study.

A second alternative would be to require CPP plan members who are older than, say, 30 years of age to contribute at higher rates so that each cohort pays for the full costs of the benefit. This would avoid intergenerational subsidization and make the benefit available much sooner. However, the contribution rate increase for the oldest cohorts would be substantial (at least in relative terms), and it would also apply to employers with older workers.

A third alternative is a compromise between the first two, where all CPP plan members between the ages of, say, 30 and 55 would be required to participate on the basis of each cohort paying its own way. Under this alternative, CPP participants over the age of 55 would not be eligible to participate and therefore would not have to contribute.

There are obviously many other design possibilities, all with their own trade-offs. Once the program matures, it would displace some of the subsidies that the provinces/territories pay to or on behalf of complex care patients who are unable to pay for the services.

Option 13b: Contributory insurance against catastrophic care costs through a "seniors disability care act"

The second mechanism is a funded catastrophic care costs benefit implemented through a "seniors disability care act." Section 94A of the Constitution authorizes Parliament to enact laws relating to old age pensions and "supplementary benefits, including survivors' and disability benefits irrespective of age." Technically, it could do so without the agreement of the provinces. But since section 94A also states that no such federal law shall "affect the operation of any law present or future of a provincial legislature in relation to any such matter," a province could effectively prohibit the implementation of a new federal program within its

jurisdiction. One or more provinces might wish to do so for any of several reasons: opposition to a new federal earmarked tax on taxpayers in its jurisdiction; inconsistency with the spirit of the consensus provisions of the CPP; overlap with provincial programs leading to confusion and waste; or symbolic considerations (opposition to Ottawa intervening through legislation where the province has primacy).

The basic design of the benefit would be the same as under option 13a. Ottawa might choose this alternative if it is unable to obtain sufficient provincial support to meet the CPP amendment rules. If all or almost all provinces are opposed, the politics of Ottawa legislating new statute law might be very difficult. But if, for the sake of argument, five or six provinces, with well over half the population, favour the substantive proposal outlined in option 13a, then option 13b might be a solution for all jurisdictions. Parliament would enact the new law under section 94A. The opt-in, opt-out choice and consequences would be the same here as in option 3.

If Quebec concurs, it would have three choices. It could do nothing, in which case the federal law would apply in Quebec. It could pass parallel legislation, or it could amend the QPP. Amending the QPP is the most likely approach, and allowing the federal law to apply the least likely. The eligibility rules issue would not arise for the QPP amendment, because the Quebec government would be the decision-making authority for programs related to both catastrophic and non-catastrophic care expenses.

Option 14: Provincial/territorial coverage of catastrophic care costs through federal legislation and transfers

The third broad approach to catastrophic care costs involves legislation to insure publicly those care services that currently are not covered. Option 14 would provide coverage for the necessary care expenses that exceed a defined threshold of catastrophic costs. It would require agreement between the two orders of government. To secure the support of the provinces/territories for such an agreement, the federal government would have to transfer more financial resources to them than it does today. This incremental transfer could take the form of a new grant program, but the provinces/territories would likely prefer to have the incremental cash transfer added to the Canada Health Transfer, since it affords them more flexibility.

The benefits provided under this option would be similar to those under option 12, but not identical. As in option 12, what constitutes catastrophic care costs would have to be determined. One important difference is that in this case the provinces would deliver the benefits (through services/subsidies provided to care recipients), whereas under option 12 Ottawa would provide a cash benefit directly to care recipients. Another difference is that under option 12 federal authorities would be able to specify all the design features of the program. Option 12 would impose few if any legal constraints on Ottawa, since it would be enacted under a constitutional power (section 94A) that authorizes the federal government to make laws. But option 14 relies on the spending power for its constitutional authority. This authority would enable Ottawa to require that a province or territory provide certain broad categories of care support as a condition of funding. But it would preclude Ottawa from specifying all the program parameters.

Again, two mechanisms are available. One would be an amendment to the *Canada Health Act* (*CHA*) to extend the scope of its coverage to include catastrophic care costs. Another would be to enact a new statute similar to but separate from the *CHA*. In either case, these new commitments would require bilateral agreements with the provinces and territories. If Ottawa offered to pay all or a significant portion of the related costs, the provinces/territories would see their costs reduced.

Option 14a: Provincial/territorial coverage of catastrophic care costs through a *Canada Health Act* amendment

For some time there have been calls to extend the scope of the *CHA* to include uncovered health care costs. The catastrophic care costs benefit proposed under option 12 would be income-tested through either the *Income Tax Act* or the *OAS Act*. Indeed, OAS benefits are already income-tested. But under the *CHA* as it now exists, there is no provision for income or asset testing. And a proposal to amend the *CHA* to cover catastrophic care expenses on an income- or asset-tested basis would almost certainly raise concerns that such an amendment would create an unfortunate precedent for the *CHA*. The argument would be that such an amendment would create a slippery slope that might one day weaken the universality of the hospital, diagnostic and medical services that the *CHA* now covers.

During the post-Second World War discussions on public health insurance, the federal and provincial governments did not commit to universal publicly insured hospital and medical services until they were satisfied that the supply was adequate to meet the anticipated growth in demand. There are now severe caregiver shortages, and there appear to be shortages of long-term care beds in nonhospital institutions as well. If this option is pursued, the supply side would have to be ramped up.

Another issue is whether the federal law would enable the provinces/territories to use different definitions of “catastrophic” care expenses in the same way that each province was free to define the “persons in need” provision under CAP. Some differences would be logical, given the differences in socio-economic circumstances among the jurisdictions.

Option 14b: Provincial/territorial coverage of catastrophic care costs through a “seniors disability care act”

This option addresses two concerns. First, the federal government might consider that having definitions of catastrophic care costs that vary from one jurisdiction to another is fitting and desirable, given the disparities in real incomes and asset allocation among the provinces/territories. This in turn leads to the argument that these new benefits should not be included as part of the *CHA*, since jurisdictional differences in coverage are not compatible with the some of the Act's principles and this could set an undesirable precedent. Second, with this option the federal government could avoid opening up the *CHA* if it is concerned that this would trigger a debate on other unrelated aspects of the Act.

Accordingly, option 14b is the same as 14a in that it would require agreement on the amount of money that Ottawa would transfer to provinces and territories for this purpose, and it would be the provinces/territories that would administer the program. Under this option, however, Parliament would enact new statute law, a “seniors disability care act,” in order to set this program apart from the *CHA*.

Supply-side options

According to the Canadian Institute for Health Information (2010), the majority (98 percent) of seniors aged 65 and older receiving publicly funded long-term home care services have one or more informal caregivers. Thus, even though in complex care cases the role for formal care is relatively more important, informal care is often an essential component. Accordingly, options 7 and 8 also apply at this end of the care continuum.

Option 15: Refundable tax credit for caregiver respite expenses

This is similar to option 7. However, the fact that in the cases of prolonged, complex care a higher proportion of caregivers would likely be assisting individuals who have severe impairments raises questions as to whether this option would be practical or effective for care recipients who are not able to make use of the tax credit without the help of a designated person. Alternative mechanisms for funding respite for informal caregivers might also be needed as a fallback.

Option 16: Refundable tax credit for informal caregivers

This is the same as option 8, but the case for supporting the informal caregivers of individuals requiring prolonged, complex care is even stronger than it is for helping those providing lighter and intermediate care. Some provinces have already begun to use this approach. It will be recalled that in its first phase this option would be based on pilot projects to determine the appropriate design and level of incentive. Given Canada's demographics, the parameters of this program would have to be assessed carefully in order to minimize undesired labour market effects.

Option 17: Federal matching capital grants for provincial/territorial investment in complex care infrastructure

This option is identical to option 9, except that the capital investment would be focused exclusively on enhancing the supply of skilled caregivers and specialized facilities required by individuals in complex care. As the first cohort of baby boomers will enter their 80s in 15 years (2026), this option should be given serious consideration.

Combined demand- and supply-side options

The federal transfers to the provinces/territories proposed under the next two options are intended to cover their operating costs related to complex care. Each jurisdiction would decide how much of this new funding would be used to subsidize more clients, thus supporting the demand side, and how much would go to hire more caregivers or invest in the training of existing caregivers, thus enhancing supply.³⁹

Option 18: Federal block funding for provincial/territorial complex care programs

This is similar to option 10, but its specific purpose would be to help the jurisdiction cover its operating costs in respect of subsidies or services provided to patients whose care costs have exceeded some defined threshold. It is thus more targeted than option 10. But like option 10, it would rely on the spending power for its constitutional authority and it would raise the same questions about how to define base-year operating costs and how to determine the amount of transfer in year 1 and its annual rate of growth.

If, as a condition for this transfer, Ottawa requires that all jurisdictions use the same definition of catastrophic costs and eligible care expenses, it might be necessary for each province/territory to draw up two eligible expense schedules — one for its own programs and one for the joint program with the federal government. The provinces/territories would likely resist. Moreover, to make such a detailed regulatory scheme a condition of the transfer might exceed federal constitutional authority. The most likely outcome therefore is that provinces would accept a general obligation to cover catastrophic care costs, with each having the legal discretion to do so subject to some *de minimis* rule. As noted for option 14a, the precedent might be the shared-cost arrangements under CAP, whereby each province had its own definition of “person in need” and the definitions varied considerably.

Option 19: Federal matching grants for provincial/territorial complex care programs

This is similar to option 11, but the matching grant would be for incremental catastrophic care costs only. The difficulty in establishing the relevant base-year-per-capita amount for provincial/territorial expenditures would arise here, as it would in option 18. The same trade-off related to federal eligibility rules for care expenses would apply here. Under this option, however, the trade-off would be less difficult than under other options, since the provinces/territories would be cost-sharing, which means there would be a strong case for using provincial/territorial rules and definitions. Since this would be a matching grant, it is assumed that Ottawa would put a cap on federal outlays.

Assessing the options for prolonged, complex care

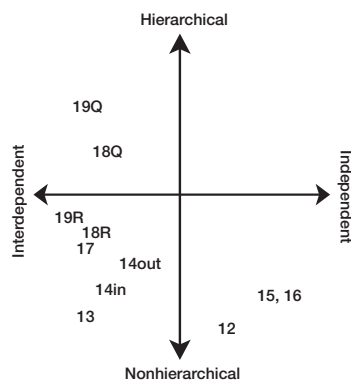

Implications for federalism and intergovernmental relations

Figure 4 illustrates the kind of federalism that is implicit in options 12 to 19. It is worth repeating that options below the horizontal axis would normally not cause major disturbances in the federation. Option 13 (contributory insurance against catastrophic care costs) is shown close to the bottom of the vertical (hierarchical/nonhierarchical) axis. Since options 13a and 13b would entail roughly the same degree of interdependence and non-hierarchy, they are not shown separately. Option 13a would require a CPP amendment and therefore significant collaboration between the two orders of government. And option 13b,

with its opt-in, opt-out provisions, is premised on the assumption that no province should be coerced into accepting a program that it does not support. Neither option would be coercive and both would require intergovernmental collaboration.

Option 12 (income- and asset-tested catastrophic care costs benefit) is in the classical federalism quadrant because such an initiative would be within federal constitutional jurisdiction, whether the mechanism used is the *OAS Act* or new disability

Figure 4: Policy options for prolonged, complex care from a federalism perspective

Note: Q = Quebec; R = rest of Canada; out = opt out; in = opt in

legislation. Provinces also have constitutional authority, however. Accordingly, to the extent that Ottawa's definition of eligible care expenses differs from those of individual provinces and territories, there would be the risk that this federal initiative would complicate the administration of their care programs. It is for this reason that this option is positioned closer to the midpoint of the independence-interdependence horizontal axis than option 1, as shown in figure 3. Option 12 is also shown close to the bottom of the vertical (hierarchical/nonhierarchical) axis because its opt-out provisions would remove any sense that Ottawa is being coercive.

Option 14 (provincial/territorial coverage of catastrophic care costs through federal legislation and transfers) is in the collaborative quadrant because it would involve both orders of government in an interdependent relationship. The provinces/territories deliver health care programs. The broad parameters of these programs have been shaped by many years of intergovernmental negotiation. The programs are paid for mainly by the provinces/territories. Ottawa's current share of funding is 20 percent if federal cash only is considered, and 30 percent if cash and the 1977 tax transfer are included. Option 14 is located higher up on the vertical axis than option 13. The reason is that Ottawa can amend the *CHA* and enact new disability legislation without provincial concurrence, whereas amending the *CPP* requires an act of Parliament and consensus of the provinces.

Option 14 would require extensive intergovernmental negotiations, however. To include catastrophic care costs under either the *CHA* or a new seniors' disability care act, Ottawa would have to persuade the provinces/territories to cover such costs as a matter of entitlement, as they have done for hospital and medical expenditures for about 50 years. To secure the agreement of the provinces/territories, the federal government would have to make it worth their while financially. A key difference between options 14 and 18 (federal block funding for provincial/territorial complex care programs) is that under the former the provinces/territories would have to commit to cover all the catastrophic care costs of every senior, whereas under the latter they would use the federal transfer to improve the situation of seniors with catastrophic care costs, but they would not be obliged to pay all or any costs incurred by a specific person. In other words, option 14 would create an entitlement, whereas option 18 would not.

Option 17 (federal matching capital grants for provincial/territorial investment in complex care infrastructure) is comparable to option 9. Although it would entail use of the federal spending power, the grants would be time-limited and focused on capital costs. Therefore this option should not raise serious intergovernmental problems. In figure 4 options 18 and 19 (federal block funding and federal matching grants for provincial/territorial complex care programs) are placed in the same position as options 10 and 11 are in figure 3.

A broader public policy perspective

Appendix 2 provides a summary assessment of options 12 to 19 using the same 10 policy criteria that were used to evaluate options 1 to 11. Several of the points made above in the analysis of light- and intermediate-care options also apply to options at this end of the care continuum.

Table 6: Policy options for prolonged, complex care that would foster good federal-provincial/territorial relations and that score well on the 10 policy criteria

Option	Type of intergovernmental regime	Type of option	Assessment from appendix 2
12. Income- and asset-tested catastrophic care costs benefit	Classical	Demand-side	Excellent 6 Very good 2 Good 1 Poor 1
13. Contributory insurance against catastrophic care costs	Collaborative	Demand-side	Excellent 4 Very good/excellent 1 Very good 2 Good-excellent 1 Fair/good 1 Fair 1
15. Refundable tax credit for caregiver respite expenses	Classical	Supply-side	Excellent 3 Very good 3 Good/very good 1 Good 3
16. Refundable tax credit for informal caregivers	Classical	Supply-side	Excellent 2 Very good 3 Good/very good 2 Good 2 Fair/good 1
17. Federal matching capital grants for provincial/territorial investment in complex care infrastructure	Collaborative	Supply-side	Excellent 1 Very good/excellent 1 Very good 3 Good 2 Fair/good 2 NA 1

First, the options that raise few concerns from a federalism perspective are also strong from a policy perspective. Second, there are policy options on both the demand and the supply sides that are compatible with those criteria that could serve as policy goals. These results are summarized in table 6. Third, the scope of potential options is broad, with ideas that could appeal to governments of different political orientations, whether market-oriented conservative, centrist or social democratic. Given these similar results, the focus here will be on the similarities and differences among the options for prolonged, complex care.

As was the case with options for light and intermediate care, the demand-side options for prolonged, complex care also performed well based on policy criteria. Options 12 and 13 (income- and asset-tested catastrophic care costs benefit, and contributory insurance against catastrophic care costs) were assessed much more favourably than option 14 (provincial/territorial coverage of catastrophic care costs through federal legislation and transfers). The principal reason is that option 14 would entail intergovernmental transfers, whereas options 12 and 13 would provide benefits directly to individuals who qualify. As a result, option 14 did less well on criteria such as accountability, political credit and administrative efficiency.

The supply-side options 15 to 17 also performed well. The two options that would involve federal conditional sharing of operating costs did not fare nearly as well. Option 18 (federal

block funding for provincial/territorial complex care programs) and option 19 (federal matching grants for provincial/territorial complex care programs) were evaluated as “fair” or “poor” on four of the ten criteria.

Under options 12 and 13, extensive federal-provincial/territorial consultation would be necessary to define catastrophic costs and eligible expenses. The issue of whether to have one or two rate schedules for caregivers and caregiving institutions in each jurisdiction would need to be resolved. For option 13a, the complexities of achieving the necessary federal-provincial/territorial consensus required for a CPP amendment and the desirability of a deal with Quebec to maintain parallelism between the CPP and the QPP would constitute a big hurdle. There would be less of a hurdle under option 12, because Parliament has the authority to legislate without the approval of the provinces/territories. In reality, however, Ottawa would be unwise to act without the provinces' agreement, since this could increase the risk of administrative snafus and could damage intergovernmental relations.

None of these considerations means that the two options should be put on the policy back burner. While Canadians may be facing a period in which fiscal resources are tight, there is never a good time as there are always more claims on the public purse than can be satisfied. In any case, the issues surrounding seniors' care entail medium- and long-term planning horizons that extend well beyond the next 12 to 18 months. The federal government could, for instance, choose to act on one of the options, undertake whatever intergovernmental negotiations are needed, introduce the required legislation in Parliament and secure its enactment, but plan to bring it into force only some years into the future. If the government waits for the right time to legislate, it may wait forever.

If the federal government thinks that option 12 is a good long-term strategy, or if it reaches an agreement with provinces regarding option 14, the situation would be somewhat analogous to the one at the end of the Second World War in relation to health insurance. At that time Ottawa tried to convince the provinces to join in a national health insurance scheme. Several provinces, including the two largest, balked. It took another two decades before both universal hospital insurance and medical insurance became available on a Canada-wide basis.

However, even if all the provinces had agreed in 1945, the existing capacity of the health system (e.g., the number of health professionals and the physical infrastructure) would not have been adequate to deal with the ensuing growth in demand. The supply-side deficiency was recognized, and in the aftermath of its initial failure to muster provincial consensus on public health insurance, Ottawa created the National Health Grants Program. Launched in 1948, this capital grants program involved federal cost-sharing with the provinces in a major expansion of the health care system. Thus, when universal hospital insurance and medical insurance became realities on a country-wide basis in the late 1950s and mid-1960s, respectively, adequate levels of skilled health care personnel and physical capital were available to respond to the additional demand. In much the same way, if option 12 or option 14 were implemented tomorrow, it is doubtful that current human resources or infrastructure would be sufficient to cope.

There is currently a significant gap between demand and supply in seniors' care services, and the federal and provincial governments (some more than others) have taken steps over the last several years to begin to address the shortfall. These actions suggest that there is a growing awareness in government circles of the challenges that Canada will face with respect to care for seniors over the next couple of decades. They do not, however, demonstrate awareness of the magnitude of the challenges. Most new public programs, including federal programs, barely qualify as baby steps. In order to gain the necessary perspective, governments should examine available empirical evidence and quantify the current gap. With that benchmark as a starting point, they need to estimate the extent to which this gap might be expected to grow over coming decades under current policies. Given current demographic and epidemiological knowledge, this task is doable. Statistics Canada has already researched many of the key variables (Carrière et al. 2008), and various groups have made similar projections for their particular purposes (Alzheimer Society 2010, 16-21).

While the demand-side options for light and intermediate care presented here include a role for the private sector, the options for prolonged, complex care do not. This reflects the argument presented earlier that pooling risk on the largest possible population base is the appropriate way to deal with the low risks and high costs associated with prolonged, complex care. With public-sector options, the issue of intergenerational equity must be considered seriously, as some programs could result in an unfair transfer of tax burden onto young and future workers. But there are options that would mitigate the risk. For example, option 13 is a contributory fund to cover future care costs, which would ease the tax burden on future generations. Option 17 would entail current taxpayers investing in current and future complex care capacity. Option 16 features pilot projects to test the effects of alternative tax incentives on the supply of informal caregivers, which could potentially reduce the need for more expensive formal care.

Earlier in this study I stressed the importance of personal autonomy. For people incurring considerable costs for complex care who still have the potential for a reasonable quality of life, the fact that all three demand-side options would put more money in their hands to purchase care services and meet other needs should increase their personal autonomy. Under options 12 and 13, the federal government would pay benefits directly to those eligible, whereas under option 14 Ottawa would transfer money to provinces and territories for the same purpose.

While personal autonomy would remain a priority for some patients, factors like pain management, patient safety and end-of-life situations loom large for those who require prolonged, complex care. These considerations speak more to the supply side than to the demand side. Option 17 is a supply-side measure that is based on the precedent of the National Health Grants Program, which helped develop the health care system after the Second World War. In the coming decade, that option could be used to ensure that there is an adequate supply of trained professionals and long-term care facilities to manage the anticipated growth in the population requiring complex care. While this would require a series of agreements between the two orders of government, the provinces/territories have much more to gain than to lose in such arrangements.

The analysis here suggests that demand- and supply-side options are not substitutes for one another but are complementary. Ideally they should be implemented sequentially, with the supply-side options dealt with first. Timing would be an important factor to consider. For instance, if there is federal-provincial/territorial agreement on option 13, benefits would not become payable for some years into the future, although how many years would depend on design details. However, if option 12 is preferred, it should not be promulgated into force until there is an adequate supply of formal caregivers and the appropriate physical infrastructure is in place.

The array of federal policy options for prolonged, complex care is not as large as it is for light and intermediate care. But it is wide enough to present the federal government with opportunities to play a constructive role on the demand side, the supply side or both. Unlike the options presented for the light and intermediate points on the care continuum, the options for prolonged, complex care do not contemplate “go it alone” alternatives. On both the demand side and the supply side, all the options are premised on the need for genuine intergovernmental collaboration.

Conclusion

The fact that demographic trends are causing the aging of Canada's population has been known for decades. Yet Canada does not have an overarching policy strategy to deal with the costs and opportunities embedded in the aging process.⁴⁰ Nor does it have a national policy for dealing with the effects of aging on the demand for and supply of care.

The constitutional responsibility for care rests with provincial governments. Although each province and territory is responsible for what happens within its borders, these jurisdictions do not have joint responsibility for the country as a whole. The federal government is the logical body to provide countrywide strategic policy direction in regard to aging and its effects on care, provided that it does so in a manner that respects provincial jurisdictional and legislative competence.

What Ottawa should do and how it should be done, however, is not an academic exercise. They depend on the facts on the ground. This study is premised on the current imbalance between the demand for and supply of care for seniors and the expectation that this imbalance will grow. The exact size of the imbalance or its trajectory over time is not known. Therefore, as a first step toward clarifying what its role could and should be, the federal government must gain a better grasp of the demand-supply relationship.

Despite the lack of clarity on what its role should be, the federal government has over the years used both its constitutional heads of power (pensions, unemployment insurance, tax law) and its spending power (transfers to provinces) to make laws and allocate resources that have, intentionally or otherwise, influenced the demand for care and also, to a much lesser extent, affected its supply. The most significant policies, implemented by both the Liberals and the Conservatives, have been those pertaining to retirement income. Neither party, however, has explicitly made the connection between the out-

comes of these policies and the demand side of the care market. As for the supply side, both parties have implemented several small measures such as tax breaks or direct grants that were explicitly aimed at caregivers or care recipients. But these constitute tinkering at the margins. They were introduced without undertaking a comprehensive analysis of the problem, or of the role the measures were meant to play in the solution. They were more about politics than about policy.

The Liberals under Jean Chrétien and Paul Martin had the opportunity to do more. Budget 2000 and the following fiscal update proclaimed victory on the deficit and noted that the federal debt was falling and the unemployment rate was at a 20-year low. This provided a window of opportunity to do something big. It could have been about aging, but as things turned out, it was about tax relief — a cut of \$100 billion over five years. A second window opened in 2003 and 2004 when the first ministers met to discuss health care reform. Depending on how one counts them, around 10 health care issues were addressed in the 10-year Plan to Strengthen Health Care. Not one of these issues was directed at aging. As the Liberals were defeated less than 18 months after the 2004 Health Accord, this failed opportunity may not have mattered. But a re-elected Martin government might have attached a greater priority to the aging issue and the seniors' care file. Indeed, only a few months earlier the Liberal general election platform had stated the Liberals' intention to "work with the provinces and stakeholder groups to develop a comprehensive strategy to increase support for 'informal' caregivers — spouses, children and close relatives and friends" (Liberal Party of Canada 2004).

This pattern of small, ad hoc initiatives has continued under Stephen Harper's government. The 2011 federal budget included a nonrefundable caregiver tax credit with a maximum annual value of \$300. It also removed the \$10,000 cap on the amount that caregivers can claim in medical and disability-related expenses for an aging parent, sibling or other financially dependent relative. For most caregivers, the amounts involved are of no consequence. In some sense, these measures can be viewed as a symbolic gesture of support toward the beneficiaries. The 2011 budget also increased the Guaranteed Income Supplement by up to \$600 annually for singles and \$840 for couples. The budget did not link the GIS increases to care costs, but nonetheless this additional income enables eligible seniors to pay for more care services (unless provinces appropriate some of the benefit increases, which they could do since many provincial care programs are income-tested). To date the Conservatives have shown as little concern for the implications of population aging as the Liberals.

The concern that motivates this study is that the federal government's inaction on this file may help turn the tsunami of aging into a "perfect storm." The coming of this tidal wave has long been forecast. This should have allowed the federal government sufficient time to plan for and manage its consequences. If the federal government has a plan, however, it has not made it public. If the government has reason to believe that Canadians will be able to cope with the aging of the population with only small "one-off" policy adjustments every now and then, it must share its analysis with the public.

What the public does know is that the proportion of the population aged 65 and over is projected to increase from 14 percent in 2009 to 23-25 percent in 2036, while the working-age proportion of the population is expected to decline from 69 percent to 60 percent over the same period. Under Statistics Canada's medium-growth scenario, the population aged 80 years and over will be 2.6 times higher in 2036 than in 2009, and 3.9 times higher by 2061 (Statistics Canada 2011). Population aging is expected to greatly increase the prevalence of dementia in Canada. In 2008, 7 percent of Canadians over the age of 60 and 49 percent of those over the age of 90 suffered from dementia. According to the Alzheimer Society, "by 2038 the number of Canadians (of all ages) with dementia will increase to 2.3 times the 2008 level, i.e., to 1.1 million people, representing 2.8% of the Canadian population" (2010, 17). The costs of caring for a person with advanced dementia are high. Whether these facts and projections will eventually translate into widespread social distress is not known, but they do raise questions that the federal government should be able to answer.

The next opportunity to make meaningful policy decisions on aging and care will be in the context of the renegotiation of the major social transfers (the Canada Social Transfer and the Canada Health Transfer). The statutory authority for these payments ends March 31, 2014. One question the Harper government should now be facing is whether it wishes to use the renegotiation as an opportunity to act strategically on the aging file.

Although there are a number of initiatives that could qualify as strategic, there are two elements that are essential to the federal government's positioning on this issue. First, it must make a diagnosis of how well the care needs of seniors are being satisfied today, and provide realistic projections of those needs at least a couple of decades into the future. Second, it must indicate what role Ottawa wishes to play going forward. In so doing, it will signal to other actors how the federal government interprets the challenges that lie ahead and what is expected of them — individuals, the family unit, friends and neighbours, business, the social economy, as well as provincial and territorial governments. If the federal government accomplishes only these two things, there will at least be a basis for consultation with the public and discussions with the provinces and territories about what needs to be done and who should do it. If it doesn't do these things, this will suggest to Canadians that the federal government believes there is no major care problem lurking down the road.

In elaborating what its future role in addressing seniors' care needs might be, the federal government should consider whether it is appropriate to continue to focus almost entirely on the demand side or whether it sees a larger role for itself on the supply side as well. The government could also indicate whether it proposes to be involved on the entire care continuum or whether it considers that it has a comparative advantage in some parts of the continuum relative to others. It could go farther still and, after holding consultations with the public and the provinces/territories, announce the specific programs it proposes to act on and over what period of time.

Given current fiscal conditions and the degree of uncertainty in the global economy, the Department of Finance will almost certainly resist substantial new expenditure commitments by the federal government. Assuming it succeeds, this would not be a reason to avoid making a diagnosis or to defer elaborating a strategy. Indeed, if anything, the opposite is true. If there are large and growing unmet care needs and the federal government, for whatever reasons, does not consider it has a role to play financially in addressing these needs, it has a political and moral obligation to say so publicly. It is worth reiterating that the federal government has no policy on seniors' care. Even with the measures announced in the June 2011 federal budget, an amount equal to perhaps 2 percent of total federal retirement-related outlays (pensions, tax deductions and shelters in pension and registered savings vehicles) is targeted explicitly for seniors' care and caregivers.

The federal government has had decades to prepare for an aging society. To their credit, Ottawa and the provinces have done much to improve Canada's retirement income system during this period. And they also appear to be responding to evidence of growing problems related to declining pension coverage and income security within that system. In doing so they can make use of models that project how well current cohorts of working age population will fare when they retire in relation to both antipoverty standards and preretirement income. But here is the rub. These models do not contain basic information about the costs of care and its incidence. Ottawa must ensure that this gap is filled both to better evaluate the adequacy of pension policy and as essential input for determining its seniors' care policy going forward.

The Constitution precludes Ottawa from regulating caregiving institutions, establishing standards for different caregiver occupations or certifying that occupational standards have been met. The federal government is not in the business of delivering care services directly to Canadians, except those for whom it has special responsibilities (the Canadian Forces and some Aboriginal people). This still leaves Ottawa with many choices regarding its role in seniors' care going forward. The object of this study has been to encourage public debate and intergovernmental discussions about what the federal role should be. I have argued that the federal government has had a big impact on the demand side of care services, even when federal policies were not explicitly crafted for that purpose. My analysis has also shown that there is a range of policy instruments available to the federal government that are federalism-friendly (they respect provincial constitutional authority) and that meet other tests of good public policy. These instruments relate to seniors' care needs across the care continuum on both the supply and the demand sides.

The range of policy instruments includes some that emphasize individual responsibility and markets and others that emphasize collective responsibility and the state. In the case of individuals and markets, there are some options that give priority to personal autonomy and choice, and others that narrow choice to ensure that funds intended for care are used for that purpose. Where the state is concerned, there are options that involve pay-as-you-go funding and others that involve prefunding. The issues of

personal autonomy and intergenerational fairness are major factors that must be weighed in considering all the options. All political parties should be able to find some instruments and options that are consistent with their values.

There are many degrees of freedom for the federal government to show leadership in seniors' care. Denying the responsibility to exercise this freedom would be one degree of freedom too many.

Appendix 1: Assessment of policy options for light and intermediate care

	Demand side				
Assessment criterion	Option 1 OAS/GIS care supplement	Option 2 CPP care supplement	Option 3 Supplementary-care-benefit-for-persons-with-disabilities legislation	Option 4 Registered care savings plan	Option 5 TFSA expansion
Target efficiency	Excellent Targets those with low incomes who face the contingency of care expenses	Excellent Targets those who face the contingency of care expenses	Excellent Targets those who face the contingency of care expenses	Very good Incentive is tied to contingency of care expenses, but not all savings will be used for that purpose	Poor General tax-sheltered savings instrument that can be used for any purpose and at any time
Economic efficiency	Good Putting purchasing power in hands of client should facilitate competition among care providers, but new spending adds to tax/debt burden	Good/very good Putting purchasing power in hands of client should facilitate competition among care providers; would require higher earmarked contributions	Good/very good Putting purchasing power in hands of client should facilitate competition among care providers; would require new earmarked contributions	Good Adds purchasing power in hands of client (tax-sheltered savings plus federal contribution), but revenues forgone would add to tax/debt burden	Fair/good Adds purchasing power in hands of client (tax-sheltered savings), but less directly than options 1 to 4
Horizontal equity	Excellent People with same income and care needs would be treated equally, regardless of location	Excellent People with same income and care needs would be treated equally, regardless of location	Excellent People with same income and care needs would be treated equally, regardless of location	Excellent People with same income and care needs would be treated equally, regardless of location; assumes same tax rules apply to provincial income tax	Excellent People with same income would be treated equally, regardless of location; assumes same tax rules apply to provincial income tax
Redistributive equity	Excellent Care supplement highly progressive	Good CPP is mildly progressive and so would be the supplement (it could be designed to be more progressive)	Good Like CPP, this benefit would be mildly progressive (it could be designed to be more progressive)	Fair/good Depends on design details; could be designed to be less regressive than current RRSP, especially with income-tested federal cash contribution	Good Absence of tax deduction on contributions and clawback effects on GIS benefits makes this option less regressive than option 4
Intergenerational equity	Poor Current seniors would receive new benefits for which they paid little or nothing; current/future taxpayers would bear the tax/debt burden	Very good/excellent Each generation would pay for all or the greater part of its benefits	Very good/excellent Each generation would pay for all or the greater part of its benefits	Very good Each generation would pay its own way, except for tax deferrals and cash contributions that add to tax/debt burden	Very good Each generation would pay its own way, except for nontaxation of withdrawals
Personal autonomy	Very good Money would follow client, who makes the choices; reduced dependence on provincial/territorial programs and subsidies	Excellent Money would follow client, who makes the choices; reduced dependence on provincial/territorial programs; prefunding provides more certainty	Excellent Money would follow client, who makes the choices; reduced dependence on provincial/territorial programs; prefunding provides more certainty	Good/very good Cash would be available when needed, but lack of flexibility in withdrawals would run counter to personal choice	Excellent Complete flexibility in saving and spending decisions

Appendix 1: Assessment of policy options for light and intermediate care

Supply side			Combined demand + supply sides		
Option 6 Grants to NGOs to build up local caregiving capacity	Option 7 Refundable tax credit for caregiver respite expenses	Option 8 Refundable tax credits for informal caregivers	Option 9 Federal matching capital grants for provincial/territorial investment in care infrastructure	Option 10 Federal block fund for provincial/territorial care programs	Option 11 Federal matching grants for provincial/territorial care programs
Fair Money goes to NGOs to provide information support to caregiving sector	Very good Money directed to intended purpose only	Good/very good Money directed to intended purpose, but could constitute a windfall to some caregivers who would provide care without the credit	Excellent Caregiving capacity should increase as federal grants are tied to incremental provincial/territorial capital spending	Good May target well initially, but "no provincial spending displacement" provision would be hard to enforce over time	Good/very good Matching grants allow better targeting than block funding, but displacement still a possibility
Fair Indirect resource allocation through NGOs; new spending would add to tax/debt burden	Very good Would encourage informal caregiving at low cost and may reduce formal care costs	Good Would leverage unpaid caregivers; incentives must be tested to avoid undesired labour market effects, but possible windfalls	Good Would enrich capital stock and address market deficiencies, but would increase tax/debt burden	Fair New federal transfer spending would add to tax/debt burden; provinces would make decisions on resource allocation	Poor New federal transfer spending would add to tax/debt burden; possible distortion of provincial/territorial resource allocation process due to matching provisions
Poor Grants would be place-specific and targeted to low-capacity regions	Excellent Care recipients in different parts of the country with the same income would be treated equally	Excellent Informal caregivers in different parts of the country in the same economic circumstances would be treated equally	Fair/good Net effect on care recipients across the country difficult to assess; depending on provincial investment decisions, differences in services among jurisdictions could narrow or widen	Good Equal-per-capita grant increases probability of people in lower-income jurisdictions receiving the same care as those in similar situations in higher-income jurisdictions	Fair/good Matching grant could favour wealthier regions and widen differences in the treatment of people in similar situations
Good Cannot assess redistributive impact, but option targets most underserved regions (proxy for low income)	Very good Refundable credit funded through progressive tax system	Very good Refundable credit funded through progressive tax system	Good Cannot assess redistributive impact of capital investments, but enhanced capacity should increase services for those most in need	Good/very good Equal-per-capita transfer funded through progressive tax system redistributes in favour of lower-income jurisdictions	Fair/good Depending on program design, matching grants could favour wealthy regions; would also depend on redistributive effects of provincial programs
Poor-good Current taxpayers would fund NGOs; current and future care services outcomes difficult to anticipate	Good Adds to tax/debt burden of current/future taxpayers, but would add to supply of informal caregivers and could reduce formal care costs	Good Adds to tax/debt burden of current/future taxpayers, but would add to supply of informal caregivers and could reduce formal care costs	Very good Current capital investments would also benefit future generations of seniors	Fair New spending would add to tax/debt burden, but this may be partly offset by enhanced caregiving capacity in the future	Fair New spending would add to tax/debt burden, but this may be partly offset by enhanced caregiving capacity in the future
Fair Much depends on the success of NGOs in enhancing access to and choice of caregiving services for care recipients	Excellent Would facilitate care recipients' autonomy in choosing respite caregiver	Fair/good Would do little directly to increase the personal autonomy of care recipients, but increased caregiver supply should improve personal choice	Fair/good Intergovernmental capital grants would not help care recipients directly, but enhanced capacity should improve personal choice	Fair/good Fiscal transfers would not help care recipients directly, but enhanced provincial/territorial care programs should improve personal choice	Fair/good Fiscal transfers would not help care recipients directly, but enhanced provincial/territorial care programs should improve personal choice

Appendix 1: Assessment of policy options for light and intermediate care (cont.)

	Demand side				
	Option 1 OAS/GIS care supplement	Option 2 CPP care supplement	Option 3 Supplementary-care-benefit-for-persons-with-disabilities legislation	Option 4 Registered care savings plan	Option 5 TFSA expansion
Mobility/portability	Excellent Benefits would be payable regardless of jurisdiction of residence	Excellent Benefits would be payable regardless of jurisdiction of residence	Excellent Benefits would be payable regardless of jurisdiction of residence	Excellent Program would be the same regardless of jurisdiction of residence	Excellent Program would be the same regardless of jurisdiction of residence
Accountability	Excellent It would be clear which government is responsible for the new supplement	Very good Slightly less clear than option 1 as it is a collaborative, intergovernmental program	Excellent It would be clear which government is responsible for the new supplement	Good/very good The locus of responsibility would be clear; cash contribution and strict conditions on withdrawals are transparent; tax expenditures are less transparent than direct expenditures	Poor/fair Although the locus of responsibility would be clear, tax expenditures are less transparent than direct expenditures or link to care expenditures
Political credit	Excellent The recipients of the new supplement would know which government is providing the supplement	Fair New payroll tax would begin immediately, while benefits would be in the distant future; in the long term, recipients may give little credit to government, as they will view benefits as entitlements for which they have paid over many years	Fair New payroll tax would begin immediately whereas benefits would be in the distant future; in the long term, recipients may give little credit to government, as they will view benefits as entitlements for which they have paid over many years	Very good Should attract some attention; the federal cash contribution could be especially popular	Good Increased limit to TFSA's would be popular
Administrative efficiency	Excellent Existing government machinery runs smoothly	Excellent Existing government machinery runs smoothly	Excellent Existing government machinery runs smoothly	Excellent Existing government machinery runs smoothly	Excellent Existing government machinery runs smoothly
Summary rating	Excellent 7 Very good 1 Good 1 Poor 1	Excellent 5 Very good/excellent 1 Very good 1 Good/very good 1 Good 1 Fair 1	Excellent 6 Very good/excellent 1 Good/very good 1 Good 1 Fair 1	Excellent 3 Very good 3 Good/very good 2 Good 1 Fair/good 1	Excellent 4 Very good 1 Good 2 Fair/good 1 Poor/fair 1 Poor 1

Appendix 1: Assessment of policy options for light and intermediate care (cont.)

Supply side			Combined demand + supply sides		
Option 6 Grants to NGOs to build up local caregiving capacity	Option 7 Refundable tax credit for caregiver respite expenses	Option 8 Refundable tax credits for unpaid caregivers	Option 9 Federal matching capital grants for provincial/ territorial investment in care infrastructure	Option 10 Federal block fund for provincial/territorial care programs	Option 11 Federal matching grants for provincial/territorial care programs
Not applicable NGOs are place-specific and the grants would be targeted to specific regions with low capacity	Excellent Credit available regardless of jurisdiction of residence	Excellent Credit available regardless of jurisdiction of residence	Not applicable	Good A condition of the transfer could be removal of barriers to mobility/residency requirements	Good/very good A condition of the transfer could be removal of barriers to mobility/residency requirements; easier to monitor than under block funding
Fair Not easy to hold NGOs accountable for outcomes in terms of enhanced caregiving capacity	Good/very good Refundable credit clearly paid by federal government	Good/very good Refundable credit clearly paid by federal government	Very good Capital spending by both orders of government, but provinces responsible and accountable for spending decisions; matching grants help federal accountability	Poor With one government taxing and another spending, accountability is difficult; and with a block fund it is difficult to enforce the “no displacement” provision over time	Fair With one government taxing and another spending, accountability is difficult, but more feasible with matching grants than with block funding
Fair Little political salience with general public, but would be well received in the NGO community	Good Depending on simplicity of administration	Very good Would affect many Canadians, either directly or through family members	Very good/ excellent Since this would involve capital projects, there would be a lot of opportunity for “announceables,” thus ensuring that the public knows that the federal government is a partner in the funding of projects	Poor Public would be unlikely to credit Ottawa, since spending and delivery would be carried out by provinces and territories, NGOs and individuals who are not federal employees	Fair Public would be unlikely to credit Ottawa, since spending and delivery would be carried out by provinces and territories, NGOs and individuals who are not federal employees, but matching grants provide opportunities to profile the federal role
Fair The government has extensive experience working with NGOs, but this would be costlier to administer and monitor than direct spending	Good CRA has much experience in managing refundable tax credits; the tax system involves self-assessment, which might create enforcement challenges	Very good CRA has much experience in managing refundable tax credits; the tax system involves self-assessment, which might create enforcement challenges; less complicated than option 7	Very good The greatest challenge would be to determine whether provincial/territorial capital spending commitments are incremental	Good With block funding it would be difficult to administer a “no displacement” provision over time; but there would be little administration necessary	Good/very good It would be easier to administer a “no displacement” provision over time than with block funding
Good 1 Poor-good 1 Fair 6 Poor 1 NA 1	Excellent 3 Very good 3 Good/very good 1 Good 3	Excellent 2 Very good 3 Good/very good 2 Good 2 Fair/good 1	Excellent 1 Very good/excellent 1 Very good 3 Good 2 Fair/good 2 NA 1	Good/very good 1 Good 4 Fair/good 1 Fair 2 Poor 2	Good/very good 3 Fair/good 3 Fair 3 Poor 1

Appendix 2: Assessment of policy options for prolonged, complex care				
	Demand side			Supply side
Assessment criterion	Option 12 Income- and asset-tested catastrophic care costs benefit	Option 13 Contributory insurance against catastrophic care costs	Option 14 Provincial/territorial coverage of catastrophic care costs through federal legislation and transfers	Option 15 Refundable tax credit for caregiver respite expenses
Target efficiency	Excellent Income tax benefit would flow directly to eligible individuals	Excellent Catastrophic care costs benefit would flow directly to eligible individuals	Very good Presumes agreement under which provinces/territories will provide this coverage; although it is impossible to track federal dollars transferred to provinces, the provinces would be under obligation as they now are under medicare	Very good Money directed to intended purpose only
Economic efficiency	Good Putting purchasing power in the hands of clients should promote competition among care providers; but new spending would add to tax/debt burden	Very good Increase in payroll tax to pay for future benefits; putting purchasing power in the hands of clients should promote competition among care providers	Fair The government that spends is not the government that taxes; increased tax/debt burden	Very good Would encourage informal caregiving at low cost and may reduce formal care costs
Horizontal equity	Excellent People with same income and care needs would be treated equally, regardless of location	Good-excellent Intergovernmental negotiations and formal agreement would be required, which could lead to Canada-wide benefit structure or to differences among provinces/territories	Good/very good Would be available in all jurisdictions, but there would be room for each to decide exactly how to interpret the statutory language, which could lead to regional differences in coverage	Excellent Care recipients in different parts of the country in the same economic circumstances would be treated equally
Redistributive equity	Excellent Income-tested refundable credit funded through progressive tax system	Fair/good Benefit is not income- or asset-tested; payroll tax is harder on low-income workers, but offers protection to the lowest-income individuals who otherwise would not be able to pay	Good Funding would come mainly from federal and provincial general revenues (progressive tax system), but benefits would not be income- or asset-tested	Very good Refundable credit funded through progressive tax system
Intergenerational equity	Poor Current seniors would receive new benefits for which they paid little or nothing; current/future taxpayers would bear the tax/debt burden	Excellent Prefunded	Poor Would entail new entitlements that are paid for out of general revenues, increasing tax/debt burden for current/future taxpayers	Good Adds to tax/debt burden of current/future taxpayers, but would add to supply of informal caregivers and could reduce formal care costs

Appendix 2: Assessment of policy options for prolonged, complex care

Supply side		Combined demand + supply sides	
<p>Option 16 Refundable tax credit for informal caregivers</p>	<p>Option 17 Federal matching capital grants for provincial/territorial investment in complex care infrastructure</p>	<p>Option 18 Federal block funding for provincial/territorial complex care programs</p>	<p>Option 19 Federal matching grants for provincial/territorial complex care programs</p>
<p>Good/very good Money directed to intended purpose, but could constitute a windfall to some caregivers who would provide care without the credit</p>	<p>Excellent Caregiving capacity should increase since federal grants would be tied to incremental provincial/territorial capital spending</p>	<p>Good May target well initially, but “no provincial spending displacement” provisions hard to enforce over time</p>	<p>Good/very good Matching grants allow better targeting than block funding, but displacement still a possibility</p>

<p>Good Adds to tax/debt burden of current/ future taxpayers, but would add to supply of informal caregivers and could reduce formal care costs</p>	<p>Very good Current capital investments would also benefit future generation of seniors</p>	<p>Fair New spending would add to tax/debt burden, but this may be partly offset by enhanced caregiving capacity in the future</p>	<p>Fair New spending would add to tax/debt burden, but this may be partly offset by enhanced caregiving capacity in the future</p>

Appendix 2: Assessment of policy options for prolonged, complex care (cont.)

	Demand side			Supply side
	Option 12 Income- and asset-tested catastrophic care costs benefit	Option 13 Contributory insurance against catastrophic care costs	Option 14 Provincial/territorial coverage of catastrophic care costs through federal legislation and transfers	Option 15 Refundable tax credit for caregiver respite expenses
Personal autonomy	Very good Refundable tax credit would be paid directly to beneficiary, who would decide where and from whom to obtain care	Very good Payroll taxes are mandatory, but benefits are paid directly to plan members, who decide where and from whom to obtain care	Good/very good As with other medicare benefits, there would be no charge for services; this may not be the same as cash in hand, but it is close	Excellent Facilitates care recipients' autonomy in choosing respite caregiver; but may be less appropriate in complex care cases
Mobility/portability	Excellent Benefits are payable regardless of jurisdiction of residence	Excellent No mobility restriction preventing the recipient of the benefit from spending the funds in the jurisdiction of her choice	Excellent <i>CHA</i> benefits are portable	Excellent Credit available regardless of jurisdiction of residence; but mobility may be less relevant for complex care recipients
Accountability	Excellent It would be clear which government is responsible for the new supplement	Very good/excellent The source of benefits is transparent; entails intergovernmental agreement and the negotiating process may be opaque, but the lines of accountability are clear once the law is in place	Poor/fair The government that spends is not the government that taxes; while the spending jurisdiction may present annual reports, provinces/territories generally will not accept being held to account by Parliament about their reports	Good/very good Refundable credit clearly paid by federal government; but this may be less relevant for cognitively impaired care recipients
Political credit	Very good The recipients of the benefit would know which government is providing the funds	Fair The new payroll tax begins immediately, while the benefits are in the distant future; recipients are unlikely to give the government credit, as they will view this as an entitlement for which they have paid over many years	Fair/good Starts off good and then declines to fair as the initial publicity recedes and it becomes another program delivered by provinces/territories and financed partly by Ottawa	Good Depending on simplicity of administration
Administrative efficiency	Excellent The Canada Revenue Agency has much experience in managing refundable tax credits; the greatest challenge would be for individual taxpayers to keep records of eligible expenses	Excellent The government CPP machinery runs smoothly and can manage another social insurance plan; the greatest challenge would be for individual taxpayers to keep records of eligible expenses	Fair/good Becomes payable at a time when the beneficiary may be vulnerable; there could be debate about eligibility criteria; this could be difficult to administer	Good Canada Revenue Agency has much experience in managing refundable tax credits; the tax system involves self-assessment, which in turn might create enforcement challenges
Summary rating	Excellent 6 Very good 2 Good 1 Poor 1	Excellent 4 Very good/excellent 1 Very good 2 Good-excellent 1 Fair/good 1 Fair 1	Excellent 1 Very good 1 Good/very good 2 Good 1 Fair/good 2 Fair 1 Poor/fair 1 Poor 1	Excellent 3 Very good 3 Good/very good 1 Good 3

Appendix 2: Assessment of policy options for prolonged, complex care (cont.)

Supply side		Combined demand + supply sides	
Option 16 Refundable tax credit for informal caregivers	Option 17 Federal matching capital grants for provincial/territorial investment in complex care infrastructure	Option 18 Federal block funding for provincial/territorial complex care programs	Option 19 Federal matching grants for provincial/territorial complex care programs
Fair/good Would do little directly to increase the personal autonomy of care recipients, but increased caregiver supply should improve personal choice	Fair/good Intergovernmental capital grants would not help care recipients directly, but enhanced supply should improve personal choice	Fair/good Fiscal transfers would not help care recipients directly, but enhanced provincial/territorial care programs should improve personal choice	Fair/good Fiscal transfers would not help care recipients directly, but enhanced provincial/territorial care programs should improve personal choice
Excellent Credit available regardless of jurisdiction of residence	Not applicable	Good A condition of the transfer could be removal of barriers to mobility/residency requirements	Good/very good A condition of the transfer could be removal of barriers to mobility/residency requirements; easier to monitor than under block funding
Good/very good Refundable credit clearly paid by federal government	Very good Capital spending by both orders of government, but provinces responsible and accountable for spending decisions; matching grants help federal accountability	Poor With one government taxing and another spending, accountability is difficult; and with a block fund it is difficult to enforce the “no displacement” provision over time	Fair With one government taxing and another spending, accountability is difficult, but more feasible with matching grants than with block funding
Very good Would affect many Canadians, either directly or through family members	Very good/excellent Since this would involve capital projects, there would be a lot of opportunity for “announceables,” thus ensuring that the public knows that the federal government is a partner in the funding of projects	Poor Public would be unlikely to credit Ottawa, since spending and delivery would be carried out by provinces and territories, NGOs and individuals who are not federal employees	Fair Public would be unlikely to credit Ottawa, since spending and delivery would be carried out by provinces and territories, NGOs and individuals who are not federal employees, but matching grants provide opportunities to profile the federal role
Very good CRA has much experience in managing refundable tax credits; the tax system involves self-assessment, which in turn might create enforcement challenges; less complicated than option 15	Very good The greatest challenge would be to determine whether provincial/territorial capital spending commitments are incremental	Good With block funding, it would be difficult to administer a “no displacement” provision over time; but there would be little administration necessary	Good/very good It would be easier to administer a “no displacement” provision over time than with block funding
Excellent 2 Very good 3 Good/very good 2 Good 2 Fair/good 1	Excellent 1 Very good/excellent 1 Very good 3 Good 2 Fair/good 2 NA 1	Good/very good 1 Good 4 Fair/good 1 Fair 2 Poor 2	Good/very good 3 Fair/good 3 Fair 3 Poor 1

Notes

- 1 Earlier research focused on the high incidence of poverty among seniors and the three pillars of the retirement income system. The financial crisis of 2008-09 and the subsequent global recession exposed weaknesses in that system and raised concerns about the future retirement income security of modest- and middle-income workers (see Wolfson 2011).
- 2 In defining home care, the Romanow Commission lists three service categories. One is "professional services such as nursing and physiotherapy, occupational therapy, and speech therapy." The other two are "personal care" and "home making and home support"; and the commission elaborates on them to include assistance with the activities of daily living "such as bathing, toileting, transferring and grooming" and "cleaning, laundry, and meal preparations" (Commission on the Future of Health Care in Canada 2002, 173). For our purposes, "care" is defined as including all three categories of care, whether paid or unpaid, and whether provided in the person's home, a nursing home, a convalescent facility or a long-term assisted-living facility that itself may offer several levels of care. Unpaid care is described as "informal." Note that this definition is broader than is typically found in provincial legislation. For example, the government of British Columbia defines care as entailing "supervision that is provided to...an adult who is (i) vulnerable because of family circumstances, age, disability, illness or frailty, and (ii) dependent on caregivers for continuing assistance or direction in the form of 3 or more prescribed services." *British Columbia Community Care and Assisted Living Act, 2002*. Accessed September 14, 2011. http://www.bclaws.ca/EPLibraries/bclaws_new/document/ID/freeside/00_02075_01#section1.
- 3 Chapter 5 of the Budget Plan states that, as "a planning assumption, major transfers to other levels of government are projected to grow at current legislated rates over the forecast period" (Finance Canada 2011).
- 4 The federal government released a document in December 2010 reporting on progress made by federal, provincial and territorial officials in sketching a framework for pooled registered pension plans, which are intended to "provide Canadians with a new, low-cost, accessible vehicle to meet their retirement objectives" (Finance Canada 2010).
- 5 To be clear, "degrees of freedom" refers to the flexibility available to the federal government within the frameworks of the Canadian Constitution and the dynamics of the federal system. It does not refer to the government's fiscal capacity to implement various options. The cost implications would properly be the subject of another paper.
- 6 Many people under the age of 65 also require care, and there is a legitimate federal role in assisting them. Accordingly, there is room for analysis of different options to nonseniors.
- 7 It is thus the opposite of Statistics Canada's definition of disability. The Participation and Activity Limitation Survey "conceptualizes disability as activity limitations and participation restrictions associated with long-term physical or mental conditions or health-related conditions" (Statistics Canada 2006c). Thus, autonomy means a person is able to carry on with daily routines of living without these limitations and restrictions. Illness and disability, whether physical, mental, cognitive, emotional or other, reduce autonomy and lead to the need for assistance.
- 8 Intergenerational fairness should not be viewed exclusively through the lens of a single program. Thus, a policy initiative in the care area might benefit one generation more than another. This could be appropriate, because, in a wider intergenerational accounting framework, the generation that benefits most from the new initiative is in other respects disadvantaged. The above description of intergenerational fairness serves as a reference point in decisions about intergenerational transfers in care policy.
- 9 Given the aging of the population and the high rate of cognitive impairment among those over 80, it is likely that this low probability will trend upwards.
- 10 The OECD uses the term social insurance to refer to programs funded exclusively through earmarked taxes or levies held in a separate account. The concept of "social insurance" that I used in this study is broader than the definition used by the OECD and is related to the socialization of risk. This wider definition does not influence my conclusions.
- 11 According to a study prepared for the US Department of Health and Human Services, "Compared to those without private insurance, disabled elders with private insurance are more likely to live alone and less likely to have children living nearby. They are also four times more likely to have some college education, eight times more likely to have incomes greater than \$30,000 and are overwhelmingly white" (Life Plans Inc. 1999).
- 12 These relate to the "establishment, maintenance, and management of hospitals, asylums, charities...in and for the province" (subsection 7), "local works and undertakings" (10), "property and civil rights in the province" (13), or "generally all matters of a merely local or private nature in the province" (16). Territories have province-like powers under statutory law.
- 13 A similar, though perhaps more complex, argument can be made about the relative wealth of seniors.
- 14 In that scenario, the role of government as regulator would not be smaller, however. A much larger nongovernmental sector could well require an enhanced regulatory regime.
- 15 See also Macdonald et al. (2009) for a recent attempt to calculate basic living expenses for seniors, including the cost of home care services. The authors conclude that the "threshold for typical seniors exceeded the Statistics Canada LICO and LIM in most cities and the maximum OAS and GIS benefit did not completely cover the basic expenses in any of the cities" that they examined.
- 16 Provincial/territorial subsidy programs that enable a person with care needs to obtain assistance, where she otherwise would be unable to do so, may also be seen as increasing demand.
- 17 The operating costs of care programs run by provincial/territorial social services and health ministries have a demand-side dimension to the extent that they include subsidies for clients/patients. They also have a large supply-side component in that operating costs are used to pay employees to manage or supervise care programs for seniors, to provide caregiving services directly, and to enter into contractual or other relationships with organizations that provide care, such as nonprofit companies. Thus, federal specific-purpose transfers aimed at increasing provincial/territorial operating budgets for caregiving can also be thought of as having both demand and supply components, unless the money is targeted precisely at one or the other.
- 18 The single largest additional source of income is investment income from sources that are not tax assisted. A large proportion of this income is received by a relatively small number of seniors.
- 19 In the case of the CPP, the provinces had the constitutional power to override federal law. Moreover, the politics of the time were such that Quebec's draft QPP had a greater impact on the final design of the CPP than did the Pearson government's initial proposal. The power of the provinces is reflected in the amendment provisions of the CPP and the fact that the statute stipulated that the CPP Fund must lend its initial large surpluses to the provinces at below-market interest rates. As for the *Canada Health Act*, the provinces had a large impact in this area as well. The first hospital and medical insurance schemes were initiated at the provincial level. And the first major national program, the *Hospital Insurance and Diagnostic Services Act, 1957*, was driven more by the provinces than by Ottawa. However, the federal government put public health insurance on the agenda in 1945, and it played a key role by encouraging the provinces to go along with the *Medical Services Act, 1966*, and the *Canada Health Act, 1984*, both of which were controversial.
- 20 In this sense, the end of matching conditional grants has helped to fulfill Prime Minister Pearson's objective during the 1960s federal-provincial negotiations: that the federation rely less on such conditional programs in the future.

- 21 Reference re Employment Insurance Act (Can.), ss. 22-23, [2005] 2 S.C.R. 669, 2005 SCC 56. Accessed September 14, 2011. <http://scc.lexum.org/en/2005/2005scc56/2005scc56.html>.
- 22 Before establishing the National Forum on Health in 1996, the federal government attempted to persuade provincial governments to participate. The provinces demurred.
- 23 Some scholars might disagree with this characterization if they view the spending power to be without basis in the Constitution and/or lacking in political legitimacy. See, for example, Alain Noël (2001, 2007, 2008).
- 24 Some federal tax incentives may affect provincial revenues, however, because the nine provinces that are part of income tax collection agreements with the federal government are obliged to accept the federal definition of "taxable income," which includes deductions for RPPs and RRSPs. Quebec tends to use similar definitions, even though it collects its own income taxes.
- 25 The Registered Disability Savings Plan (RSDP) is a long-term savings plan to help Canadians with disabilities and their families. It is available to residents under 60 who are eligible for the disability amount. It differs from the RRSP and the proposed RCSP in many ways. Contributions are not tax deductible and earnings accumulate tax-free, but only until money is withdrawn. The federal government also pays a matching grant of up to \$3,500 a year (up to a lifetime maximum of \$70,000), depending on the amount contributed and the beneficiary's family income. There is a lifetime contribution limit of \$200,000. Ottawa will also pay a bond of up to \$1,000 a year into the RSDPs of low- and modest-income Canadians. No contribution is necessary to receive the bond. Disability savings grants and bonds can be paid into an RSDP until the year the beneficiary turns 49 years old, and they are taxable upon withdrawal (Canada Revenue Agency 2011).
- 26 Proposals made by the Canadian Medical Association (2010, 18) overlap with this option and option 2.
- 27 The benefits of RRSPs and RPPs include a tax deduction on money invested through the registered vehicle and the tax shelter of interest, dividends and capital gains subsequently earned. The problem for modest- and middle-income earners is the steep tax-back rates they could face when they take their money out after retirement. This is because the income withdrawn from RRSPs and RPPs not only is subject to income tax, but is also taken into account in determining eligibility for OAS/GIS. TFSA's do not provide a tax deduction on initial contributions, but they do provide the same tax shelter for investment income as do RPPs and RRSPs. More importantly, income withdrawn from these accounts is not subject to income tax and it does not affect eligibility for OAS/GIS benefits (Horner 2011). For higher-income earners the arithmetic is different. The initial tax deduction is worth more to high-income earners than it is to middle- and modest-income earners, because the former have a higher marginal tax rate. The issue of steep tax-back rates on withdrawals does not apply in the case of high earners, because they do not qualify for income-tested OAS/GIS.
- 28 In cases where the care recipient has a cognitive impairment, the initiative for respite might have to come from the formal caregiver or local community centre that is managing the case.
- 29 A question that arises with this option is whether the care recipient would need to "preregister" with the Canada Revenue Agency and have a preclearance with, for example, a letter from a physician or social worker. Alternatively, since the *Income Tax Act* is based on the principle of self-assessment, the CRA could simply inform the public that the benefit is subject to audit, and the recipient should keep a letter on hand about her condition and her care needs.
- 30 See McGregor and Ronald (2011) for a discussion of shortages and capacity building in long-term care across Canada.
- 31 Quebec was the last province to establish a medical insurance program, so it did not receive matching grants for a few years when most other provinces were receiving them.
- 32 There are conflicting views about this statement. Alain Noël, for example, would argue that several federal initiatives do not bear out my assertion that there are few egregious transgressions of SUFA's broad principles and its more important procedures (Noël 2000b). By far the most important federal-provincial agreement was the 2004 Health Accord. My view is that the conditionality of the document is largely "spin." When it began increasing its transfers to the provinces/territories in the late 1990s and early 2000s, the Liberal government targeted some of the money for specific purposes, fully aware that once its dollars entered the provincial revenue stream, they became fully fungible. The government did this because it was squeezed between the proverbial rock and hard place. Many Liberals and advisers believed that restoring federal transfers to earlier levels would further inflate provincial/territorial health care costs without buying reform. But public opinion data showed that a large majority of Canadians believed that Ottawa was not contributing its fair share to medicare. This second concern outweighed the first. Accordingly, Prime Ministers Chrétien in 2003 and Martin in 2004 decided to use the much-improved federal coffers to buy peace with the premiers. The appearance of targeting was their fig leaf to cover the fact that the federal government lacked the legal authority and political power to enforce its views. Thus, a 2007 report by the Health Council of Canada, acting on a mandate from the First Ministers, stated plainly: "We are unable to specify where the provinces and territories are investing funds from the federal health care agreements because no financial breakdowns are provided" (Health Council of Canada 2007, 1). As for the 2004 Accord, when the House of Commons Standing Committee on Health reviewed progress on implementation of its pharmacare and home care commitments in 2008, it reported that neither commitment had been fulfilled. The report used terms such as "stalled" (House of Commons 2008).
- 33 Before presenting the assessment, it must be acknowledged that the table necessarily leaves out important details. For example, options 2, 3 and 4 are assessed as "excellent" from an intergenerational perspective in that "each generation pays its own way." A more detailed analysis would also acknowledge the tax expenditures associated with these programs and therefore that determining the intergovernmental impacts requires more detailed calculations.
- 34 If the reader disagrees with the distinction I make between policy goals and other factors to be taken into account, he/she can substitute his/her policy goals for mine and undertake the same analysis.
- 35 This is not entirely true, to the extent that there are tax deductions, tax shelters and direct payments associated with options 2, 3 and 4. The net costs of these features would be partially offset by the reduced need to subsidize the care of people when they become seniors.
- 36 In a 2009 report the Canadian Healthcare Association showed that each province uses a different nomenclature for facility-based care (table 1, 40).
- 37 In British Columbia the maximum that seniors with complex care needs are required to pay for residential care is just under \$36,000 annually (British Columbia 2002), which is for those with the highest incomes. Therefore, it would take about 18 months of living in a secure and supervised facility to exceed, say, a \$50,000 cumulative amount. For those with lower incomes it would take longer.
- 38 The number of variations on this option is almost infinite. For example, for the purpose of determining eligibility for benefits at age 65 and over, the plan could count eligible expenses beginning at a younger age — say, 50.
- 39 In practice, these federal contributions are fungible once they are part of provincial/territorial consolidated revenues.
- 40 A document commissioned by the Federal, Provincial and Territorial Committee of Officials, entitled *Healthy Aging in Canada: A New Vision, a Vital Investment* is not such a strategy, although it could be part of one. It does not deal substantively with retirement income policy, health policy or care policy (Public Health Agency of Canada 2006).

About This Study

This publication was published as part of the Faces of Aging research program under the direction of Sarah Fortin and France St-Hilaire. The manuscript was copy-edited by Jane Broderick, proofreading was by Barbara Czarnecki, editorial coordination was by Francesca Worrall, production was by Chantal Létourneau, art direction was by Schumacher Design and printing was by AGL Graphiques.

Harvey Lazar is adjunct professor at the School of Public Administration and senior research associate at the Centre for Global Studies, University of Victoria. He spent much of his career in Ottawa. From 1997 to 2005 he was director of the Queen's Institute of Intergovernmental Relations. He has edited or co-edited and co-authored nine volumes, including *Spheres of Governance: Comparative Studies of Cities in Multilevel Governance Systems* (2007); *Canadian Fiscal Arrangements: What Works, What Might Work Better* (2005); and *Money, Politics and Health Care* (2004). His current research is on health care reform in Canada.

Lazar, Harvey. 2011. *Many Degrees of Policy Freedom: The Federal Government's Role in Care for Seniors*. IRPP Study 24. Montreal: Institute for Research on Public Policy.

Founded in 1972, the Institute for Research on Public Policy is an independent, national, bilingual, nonprofit organization. The IRPP seeks to improve public policy in Canada by generating research, providing insight and sparking debate on current and emerging policy issues facing Canadians and their governments. The Institute's independence is assured by an endowment fund, to which federal and provincial governments and the private sector contributed in the early 1970s.

Fondé en 1972, l'Institut de recherche en politiques publiques est un organisme canadien indépendant, bilingue et sans but lucratif. L'IRPP cherche à améliorer les politiques publiques canadiennes en effectuant des travaux de recherche, en mettant de l'avant de nouvelles perspectives et en suscitant des débats sur les grands enjeux actuels et les défis à venir pour le Canada. L'indépendance de l'Institut est assurée par un fonds de dotation établi au début des années 1970 grâce aux contributions des gouvernements fédéral et provinciaux ainsi que du secteur privé.
